TECHNICAL NOTES

USDA-Natural Resources Conservation Service
Boise, Idaho

TN RANGE NO. 10 **April 2001**

The attached Range Technical Note is a republished article from RANGELANDS 14 (3), June 1992. Drs. Lee A. Sharp, Ken Sanders, and Neil Rimy authored it.

The photo data depicts the variability that can be observed on seeded rangelands that we usually assume to be relatively stable for species composition and production because they receive uniform treatment and are primarily long lived perennial species. The site where the photos were taken was not grazed by domestic livestock during the duration of the study. These kinds of variation in species composition and production need to be kept in mind when working with producers.
