

Nutrient Management 590 Practice Narrative

A nutrient budget will be developed for the planned crop rotation using the WY-ECS-44 (Nutrient Management Job Sheet). The primary role of nutrient management is to minimize nutrient losses from fields while optimizing crop yield and improving soil quality, which will protect surface and groundwater resources. Crop nutrient requirements will be determined using the University of Wyoming Guide to Fertilizer Recommendations, Bulletin B-1045 (Agronomy Technical Note # 10) and a soil test which will be no more than 5 years old.
