

# Cover Crop (340)

## Conservation Practice Job Sheet

### Definition

A cover crop is a crop that is not harvested or generally grazed but is grown to benefit the soil and/or other crops in numerous ways. Benefits include: reduced soil erosion, improved soil quality, reduced weed and insect/nematode pressures. Cover crops are grown during or between primary cropping seasons. Legume crops fix atmospheric nitrogen into a form plants and microorganisms can use. In areas with nitrogen ground water problems non-legume species can recycle existing soil nitrogen and can reduce the risk of excess nitrogen (N) leaching into ground water.

### Purpose

Cover crops function by:

- Reducing erosion from wind and water.
- Sequester carbon in plant biomass and soils to increase soil organic matter content.
- Capture and recycle excess nutrients in the soil profile.
- Promote biological nitrogen fixation and reduce energy use.
- Increase biodiversity.
- Weed suppression.
- Soil moisture management.
- Minimize and reduce soil compaction.

### Condition Where Used

Cover crops are used on all lands requiring vegetative cover for natural resource protection and or additions of nutrients and organic matter.

Natural Resources Conservation Service – Idaho

January 2012

## Resource Management System

Cover crops are normally established concurrently with other practices as part of a resource management system for a conservation management unit. They should be annually installed when vegetative material is needed as green growth of residue to protect an area against wind and water erosion or to enhance the nutrient and organic contents of the soil resource. When mixing cover crop species generally split rate at in half, several combinations can be split 60/40.

A cover crop is considered part of the crop rotation. Cover crop residue shall not be burned.

## Wildlife

Cover crops can enhance wildlife objectives, depending on the vegetative species used and management practiced. Using native or adapted vegetative species can improve the wildlife values of a cover crop as well as biodiversity. Avoid mowing during nesting periods.

Table 1. Legume cover crop species with associated agronomic data.

## Operation and Maintenance

Terminate cover crop as late in the summer or fall as possible allowing adequate vegetative growth to protect against erosion during critical erosion stages.

When managing for soil nutrient additions, incorporate leguminous cover crops just before or at full bloom. To eliminate potential insect or disease infestations associated with growing green tissue (the green bridge) cover crops should be terminated at least two-three weeks prior to planting the next crop. If established for wildlife habitat, avoid termination during the nesting period of ground-nesting wildlife. Control undesirable weed species. Fertilize to soil test recommendations to maintain a vigorous stand. Only particular strains of rhizobium provide optimum nitrogen production for each group of legumes. Rhizobium is purchased by type or legume group. If seed is not inoculated when purchased coat the seed with milk, weak sugar water or a commercial sticking agent to help the material stick to the seeds.

Table 1 and 2 list single species seedings recommendations. Mixing species can greatly increase biological diversity. See Agronomy Tech Note #56 Cover Crops for additional information.

## Specifications

Additional provisions are entered on the job sheet. Specifications are prepared in accordance with the NRCS Field Office Technical Guide. See practice standard Cover Crop, code 340. Additional references are cited on the standard.

## Conservation Practice Job Sheet

<b>Seedbed preparation</b>
<p>Prepare a firm, weed-free seedbed. Cultivate seedbed and leave firm so that an average person's tracks are not more than 1/2" deep. No-till plantings may also be completed.</p> <p>Additional requirements:</p>
<b>Planting Methods</b>
<p>Drill (preferred) or broadcast uniformly over the area based on Tables 1 and 2,</p> <p>Additional requirements:</p>
<b>Operation and Maintenance</b>
<p>Perform all seedbed preparation and planting operations in a manner that will minimize erosion until cover is established. Control weeds in the cover crop, if necessary, by mowing or herbicide application. Terminate cover crop as late as possible to maximize plant growth while retaining adequate soil moisture for the subsequent crop. To avoid insect or disease infestations associated with green tissue, terminate cover crop at least 2-3 weeks prior to planting the next crop.</p>
