

**NATURAL RESOURCES CONSERVATION SERVICE
CONSERVATION PRACTICE STANDARD**

CRITICAL AREA PLANTING

(Ac.)

CODE 342

DEFINITION

Establishing permanent vegetation on sites that have or are expected to have high erosion rates, and on sites that have physical, chemical, or biological conditions that prevent the establishment of vegetation with normal practices.

PURPOSE

- Stabilize areas with existing or expected high rates of soil erosion by water
- Stabilize areas with existing or expected high rates of soil erosion by wind
- Rehabilitate and revegetate degraded sites that cannot be stabilized through normal farming practices
- Stabilize coastal areas, such as sand dunes and riparian areas

CONDITIONS WHERE PRACTICE APPLIES

This practice applies to highly disturbed areas such as active or abandoned mined lands, urban conservation sites, road construction areas, conservation practice construction sites, areas needing stabilization before or after natural disasters such as floods, hurricanes, tornados, wildfires, and other areas degraded by human activities or natural events.

CRITERIA

General Criteria Applicable To All Purposes

A site investigation shall be conducted to identify any physical, chemical, or biological conditions that could affect the successful establishment of vegetation.

Species selected for seeding or planting shall be suited to current site conditions and intended uses.

No plants on the state noxious weed or invasive plant species list shall be planted.

Selected species will have the capacity to achieve adequate density and vigor within an appropriate period to stabilize the site sufficiently to permit suited uses with ordinary management activities.

Species, rates of seeding or planting, minimum quality of planting stock, such as pure live seed (PLS) or stem caliper, method of seedbed preparation, and method of establishment shall be specified before application. Only viable, high quality seed or planting stock will be used.

Seeding or planting shall be done at a time and in a manner that best ensures establishment and growth of the selected species. What constitutes successful establishment (e.g., minimum percent ground/canopy cover, percent survival, stand density, etc.) will be specified before application.

Planting dates shall be scheduled during approved dates for the species and to optimize soil moisture for germination and/or establishment.

Apply soil amendments (e.g., lime, fertilizer, compost) at rates necessary to ensure stand establishment.

Plantings shall be protected from pests (e.g., weeds, insects, diseases, livestock, and wildlife) as necessary to ensure stand establishment.

All soil amendment application and pest control shall follow the requirements in the Field Office Technical Guide (FOTG).

The amount of plant biomass and cover needed to reduce wind and water erosion to the planned soil loss objective shall be determined using the current approved wind and/or water erosion prediction technology.

Additional Criteria to Restore Degraded Sites

If gullies or deep rills are present, they will be treated, if feasible, to allow equipment operation and ensure proper site and seedbed preparation.

Based on a soil test or general recommendations as noted in the specification, soil amendments will be added as necessary to ameliorate or eliminate physical or chemical conditions that inhibit plant establishment and growth. Required amendments, (e.g., compost or manure) to add organic matter and improve soil structure and water-holding capacity, agricultural limestone to increase the pH of acid soils, or elemental sulfur to lower the pH of calcareous soils shall be included in the site specification with amounts, timing, and method of application.

Additional Criteria to Restore Sand Dunes and Blowouts

Plants for sand dunes and blowouts must be able to survive being buried by blowing sand, sand blasting, drought, heat, and low nutrient supply.

Local plant lists including appropriate species and varieties shall be developed and utilized.

Sand trapping devices such as sand fences or brush matting shall be included in the revegetation/stabilization plans where applicable.

CONSIDERATIONS

Species or mixes that are adapted to the site and have multiple values should be considered. Native species should be considered when appropriate to site treatment.

Avoid species that may harbor pests. Species diversity should be considered to avoid loss of function due to species-specific pests.

Plans should be in compliance with the Migratory Bird Treaty Act.

Planning and installation of other Conservation Practices such as Diversions, Land Smoothing, Obstruction Removal, Surface and Subsurface Drains, or Underground Outlets may be necessary to prepare a critical area for planting.

If mulching is needed, follow the Conservation Practice 484, Mulching.

When planning nutrient applications and tillage applications, encourage soil carbon buildup while discouraging greenhouse gas emissions.

PLANS AND SPECIFICATIONS

Prepare plans and specifications for each field or management unit according to the criteria and operation and maintenance sections of this standard. Specifications shall describe the requirements for applying this practice to meet the intended purpose.

Record practice specifications using approved specification sheets, job sheets, or other acceptable documentation.

The following elements shall be addressed in the plan, as applicable, to meet the intended purpose.

- Site preparation
- Topsoil
- Fertilizer application
- Seedbed/planting bed preparation
- Methods of seeding/planting
- Time of seeding/planting
- Selection of species and varieties
- Seed/plant source
- Seed analysis
- Rates of seeding
- Mulching
- Planting trees and shrubs
- Supplemental water for plant establishment
- Protection of plantings

OPERATION AND MAINTENANCE

Use of the area shall be managed as long as necessary to stabilize the site and achieve the intended purpose.

Control or exclude pests that will interfere with the timely establishment of vegetation.

Inspections, reseeding or replanting, fertilization, and pest control may be needed to ensure that this practice functions as intended throughout its expected life. Observation of establishment progress and success should be performed at

regular intervals until the practice has met the criteria for successful establishment and implementation.

Where establishment of vegetation creates potential habitat for grass-nesting birds, the impacts of vegetative disturbance upon these birds and their nests should be considered and included in operation and maintenance plans. Maintenance activities that result in disturbance

of vegetation will not be conducted during the primary nesting season for grass-nesting birds where occupied habitat for these species exists.
