

Land Reconstruction, Abandoned Mined Land (Acre) Code 543

DEFINITION

Restoring land and water areas that are adversely affected by past mining practices and increasing the productivity of the areas for a beneficial use.

PURPOSE

- Stabilize mined areas so that they can be used to support desirable vegetation
- Reduce erosion and sedimentation
- Enhance water quality or quantity
- Maintain or improve the visual quality of the landscape
- Protect public health, safety, and general welfare.

CONDITIONS WHERE PRACTICE APPLIES

On abandoned mined land that degrades the quality of the environment, prevents or interferes with the beneficial use of land or water resources, or endangers the health or safety of individuals.

The standard applies to the construction, grading, and reshaping of land that has been disturbed or adversely affected by past mining of all minerals and commodities.

CRITERIA

General Criteria Applicable to All Purposes

Reconstruction of abandoned mined land shall be planned, designed, and installed to meet all federal, state, local and tribal laws and regulations.

Land reconstruction on abandoned mined lands shall include the components necessary to reclaim and stabilize the area and prevent further degradation of air, water, soil, and plant resources. The system may consist of one or two components such as Fire Control (451) and Toxic Discharge Control (455). Traditional practices such as terraces, grade stabilization structures, and critical area treatment components shall be used as appropriate.

Site preparation. Areas to be graded shall be cleared of trees, logs, brush, rubbish, and other undesirable materials that can prevent proper application of the practice. These materials shall be disposed of in a manner that precludes interference with water disposal practices, stabilization operations, or the operations associated with the planned use of the land.

Unsuitable soil material must be removed and buried so that it does not adversely affect water quality or plant growth. These materials must be disposed of in a manner that minimizes the potential for seepage, which can pollute surface and groundwater. Materials containing heavy metals must be buried to a depth below the root zone, or suitable kinds and amounts of soil amendments must be added.

Overhanging rocks and walls that are to be covered shall be sloped to ½ horizontal to 1 vertical slope before the soil is placed against the wall, unless a flatter slope is needed for stability. Unless otherwise specified, fill material shall be spread in successive layers not more than 2 feet (0.6 m) thick.

Removal and placement of material for final cover. Any soil material on the site that is suitable for the intended final use shall be salvaged, stockpiled, and protected for use as final cover material.

The reconstructed soil must meet the requirements for the specified land use on at least 80 percent of the area. The rest of the area must be in such a condition that it can be stabilized.

The salvaged material and other suitable materials must be spread over the graded areas to the depth specified in the reclamation plan. The final slope must permit application of needed conservation and management practices to keep soil losses within

planned permissible levels. If settlement is likely to interfere with the planned use of the land, surface drainage or water disposal, allowances must be made for the expected settlement during final grading.

Temporary seeding, mulching, water disposal and similar measures to help control erosion should be used as necessary.

Water disposal. The need for a water disposal system shall be carefully analyzed, and if needed, it shall be included in the design. The system must be intensive enough to control erosion during and after stabilization. If any practices are to be removed after vegetation is established, provisions must be made to promptly stabilize all disturbed areas. Water disposal systems suitable for intensively farmed cropland are usually required for mined land reclamation and may be used as a guide in the absence of local experience.

Establishment. Due to the nature of mine reclamation work, it is not always possible to achieve complete stabilization with the first effort. Provisions shall be made to:

- promptly fill and vegetate areas of excessive settlement
- repair and revegetate bare spots and eroded areas
- add soil amendments to achieve the physical or chemical soil conditions suitable for plant growth or replace with suitable soil materials
- add plant nutrients to achieve acceptable plant development
- install additional structural measures needed, such as terraces, lined waterways and grade stabilization structures

Use vegetation adapted to the site that will accomplish the desired purpose. Preference shall be given to native species in order to reduce the introduction of invasive plant species; provide management of existing invasive species; and minimize the economic, ecological, and human health impacts that invasive species may cause. If native plant materials are not adaptable or proven effective

for the planned use, then non-native species may be used. Refer to the Field Office Technical Guide, Section II, Invasive Plant Species for plant materials identified as invasive species.

Restoration of borrow area. If cover material is taken from outside the reclamation site, the borrow area must be graded and reshaped to insure proper drainage and be revegetated to control erosion.

If the cover material is taken from adjacent land, the topsoil from the borrow area must be stockpiled separately and replaced after the borrow area is restored for its intended purpose.

If the borrow area is prime farmland, the A and B horizons (or the B and C horizons if applicable) must be removed and stockpiled separately by horizon and then replaced on the borrow area in natural sequence. The combined thickness of the replaced horizons shall be adequate to restore the original soil productivity. Treatment of the borrow area shall meet the requirements of Land Reconstruction, Currently Mined Land (544).

Additional Criteria to Maintain or Improve the Visual Quality of the Landscape

The appearance of the reclaimed site must be in accordance with standards for maintaining and improving the visual quality of the landscape and must be compatible with the adjacent landscape. Areas of high public visibility or those offering direct or indirect human benefits shall be evaluated and considered in landscape resource management planning and design. Soil piles and borrow areas shall be shaped to blend with the adjacent landscape as much as possible.

Criteria to Protect Public Health, Safety, and General Welfare

Provisions must be made to reduce potential safety hazards and erosion and water pollution problems in areas that have highwalls and landslides. Treatment shall meet or exceed the requirements of NRCS national standards for Land Reclamation, Landslide Treatment (453) and Land Reclamation, Highwall Treatment (456) as appropriate.

CONSIDERATIONS

Consider the potential effects of installation and operation of reconstructing abandoned mined land on the cultural, archeological, historic and economic resources.

A detailed soil survey should be made of the area to be reclaimed and the proposed borrow area to identify the types and extent of soil materials.

Consider the need for access roads that would facilitate final reclamation activities and operation and maintenance.

Reclamation has great potential for increasing or improving wildlife habitat in the reclaimed area. Avoid monocultures when developing vegetative specifications.

A special concern is the potential for uncovering or redistributing toxic materials from earth moving activities.

Consider the impact on cultural resources during planning, installation, and maintenance. This practice should be in compliance with 420GM Part 401 concerning cultural resources.

PLANS AND SPECIFICATIONS

Plans and specifications shall be prepared in accordance with the criteria of this standard and shall describe the requirements for applying the practice to achieve its intended use.

Support data documentation requirements are as follows:

- Inventory and evaluation records
 - Assistance notes or special report
- Survey notes, where applicable
 - Design survey
 - Construction layout survey
 - Construction check survey
- Design records
 - Physical data, functional requirements and site constraints, where applicable
 - Soils/subsurface investigation report, where applicable
- Design and quantity calculations

- Construction drawings/specifications with:
 - Location map
 - Designed by” and “Checked by” names or initials
 - Approval signature
 - Job class designation
 - Initials from preconstruction conference
 - As-built notes
- Construction inspection records
 - Assistance notes or separate inspection records
 - Construction approval signature
- Record of any variances approved, where applicable
- Record of approvals of in-field changes affecting function and/or job class, where applicable.

OPERATION AND MAINTENANCE

A plan shall be prepared that provides specific details concerning maintenance and operation of conservation practices identified in the reclamation plan. The maintenance and operation plan shall specify procedures for:

- filling areas where settlement may adversely affect drainage and land use
- promptly repairing and re-vegetating bare spots and eroded areas
- adding soil amendments to soils that cannot support adequate vegetation or replacing them with suitable soil material
- maintaining access roads
- keeping drainage structures and channels clean and functional
- applying fertilizer and lime
- controlling weeds
- using proper grazing practices
- controlling vehicular traffic
