13.	SYSTEM NARRATIVE	<p>This benchmark system consists of areas that are primarily native grasses, forbs, trees, and shrubs but may also have some introduced vegetation such as bermudagrass. These areas are typically used for grazing and/or loafing areas incidental to other landuses in the same management unit. Typically, animal numbers are not in balance with forage supply. Supplemental feed is necessary. There are no air, or animal resource concerns. There are typically natural drains, classic gully erosion, geologic erosion, and soil conditions not suitable for crop production and limiting for forage production. Ponds are typically contaminated with excessive sediment from runoff and animal wastes. The plant population is healthy and stable but is less than desired for good range condition. The current management system has not resulted in degradation of the resource conditions.</p>
