

Gadsden County, Florida
Nontechnical Soil Descriptions

Nontechnical soil descriptions describe soil properties or management considerations specific to a soil map unit or group of map units. These descriptions are written in terminology that nontechnical users of soil survey information can understand and are used to create reports. By linking the description to the soil survey map units these reports can be generated by conservation planners and other NRCS employees for distribution to land users. These descriptions are available through both TOOLKIT and NASIS.

In this subsection nontechnical descriptions are available through four categories they are Agronomic, Ecological Community, Urban, and Water Quality. Separate map unit to description links are provided for each category.

AGRONOMIC

The following agronomic categories are available and linked through the Land Capability Unit (LCU) that are listed below.

Category

- aSOI - Soil Characteristics
- bSAC - Soil Agronomic Characteristics
- cH2O - Seasonal High Water Table
- dCUL - Cultivation Limitations
- eERO - Erosion Control
- fIRR - Irrigation Needs
- hPAS - Pasture and Hayland
- iWMG - Water Table Management

Map Units without an LCU listed are either not suited to these uses or suitability is so variable that it must be determined on-site.

ECOLOGICAL COMMUNITY

The following categories are available below.

kRNG - Rangeland (not developed, no significant application in the area served by this field office.)

IWLD - Wildlife Suitability

mWOD - Woodland Suitability

EC 4 (Longleaf Pine-Turkey Oak Hills) - Map Units: BcB*,EcB,EcD,EdB,EmB,EmC,KsB*,KsC*,LaB,LaD,LcB,LcD,LsF,LtC*,LtD*,LtF*

EC 5 (Mixed Hardwood and Pines) - Map Units: AdB,AdC,AfD,AfF,BaC,BcB*,BfB,BfC,BtB,CaC3,CnA,CnB,CnB2,CnC,CnC2,CnD,CrB,CrC,CsD,CsF,EsA,EsB,EsC,FaC3,FaD3,FmA,FmB,FmB2,FmC,FmC2,FmD,FsD,FsD3,FsF,FsF3,GoA,GoB,GmA,GmB,GmC,Gu,Ha,Ig,KaA,KbA,KbB,KcB,KsB*,KsC*,LdB,LdD,LeA,LeB,LmC,LnB,LnD,LtC*,LtD*,LtF*,LyA,LyB,LzA,LzB,MfB3,MfC3,MfD3,MgA,MgA2,MgB,MgB2,MgC,MgC2,MgD,NfA,NfB,NfB2,NfC,NfC2,NfD,NpA,NpB,NpB2,NsA,NsB,NsC,NsD,NtA,NtB,NtC,OfA,OfB,OfB2,OfC,OfC2,OfD,OtA,OtB,OtC,OtD,PcA*,PhA,PhB,RbB3,RbC3,RbD3,ReA,ReB,ReB2,ReC,ReC2,ReD,RfC3,RmA,RmB,RmB2,RmC,RmC2,RmD,RsA,RsB,RsC,RsD,RtC,RtD,RtF,RtF3,RbB,SaB,SaC,ShB,SnB,SnC,SrD,SrF,SsD,SsF,TfA,TfB,TfB2,TfC2,ZuB,ZuC

EC 7 (North Florida Flatwoods) - Map Units: Lw,PcA*,PsA,PsB*

EC 17 (Cypress Swamp) - Map Units: Gr*,Pt*,Ra*,RuA*

EC 20 (Bottomland Hardwoods) - Map Units: Ab,Co,HcB,Lv,MyB,PsA*, Sw

EC 21 (Swamp Hardwoods) - Map Units: Gr*,Pt*,Ra*,RuA*

EC 22 (Shrub Bogs - Bay Swamps) - Map Unit: PsB*

* - These Map Units have more than one type of Ecological Community.

Map Units without an Ecological Community listed are not suited to these uses or suitability is so variable that it must be determined on-site.

URBAN USES

The following additional nontechnical descriptions are available for urban interpretations:

oURB - Urban Use Statement

A101 - Map Units - Ab, Co, Gr, Ha, HcB, KaA, Lv, MyB, Pt, Ra,RuA, Sw

A102 - Map Units - BtB, Ig, KbA, KbB, KsB, LeA, LeB, Lw, LyA, LzB, PcA, PhA, PhB, PsA, PsB, RbB, SaB, SaC, ZuB

A103 - Map Units - BaC, CrB, CrC, ShB, SnB, SnC

A104 - Map Units - CaC3, CnA, CnB, CnB2, CnC, CnC2, GoA, GoB, GmA, GmB, GmC, LyB, NfA, NfB, NfB2, NfC, NfC2, NpA, NpB, NpB2, TfA, TfB, TfB2, TfC2, ZuC

A105 - Map Units - AdB, AdC, BcB, BfB, BfC, EcB, EdB, EmB, EmC,EsA, EsB, EsC, FaC3, FmA, FmB, FmB2, FmC, FmC2, KcB, KsC, LaB, LcB, LdB, LmC, LnB, LtC, MfB3, MfC3, MgA2, MgB, MgB2, MgC, MgC2, NsA, NsB, NsC, NtA, NtB, NtC, OfA, OfB, OfB2, OfC, OfC2, OtA, OtB, OtC, RbB3, RbC3, ReA, ReB, ReB2, ReC, eC2, RfC3, RmA, RmB, RmB2, RmC, RmC2, RsA, RsB, RsC, RtC

A106 - Map Units - AtF, CsF, FsF, FsF3, Gu, LsF, LtF, RtF, RtF3, SrF, SsF

A107 - Map Units - AfD, CnD, CsD, EcD, FaD3, FmD, FsD, FsD3, LaD, LcD, LdD, LnD, LtD, MfD3, MgD, NfD, NsD, OfD, OtD, RbD3, ReD, RmD, RsD, RtD,SrD, SsD

Map units without a link listed are either not suited to these uses or suitability is so variable that it must be determined on-site.

WATER QUALITY

The last group of nontechnical description in this subsection of this FOTG is that group dealing with water quality, specifically pesticide and nutrient management. The link between the statements and the map units is listed below.

sWQ – Water Quality Statement

tPES- Pesticide Management Statement

uNUT – Nutrient Management Statement

01 - Map Units - none

02 - Map Units - AdB,AdC,AfD(Blanton),EcB,EcD,EdB,EmB,EmC,EsA,EsB,EsC,GmA,GmB,GmC,HcB,KcB,KsC,LaB,LaD,LcB,LcD,LdB,LdD,LmC,LnB,LnD,LtC(Troup),LtD(Troup),NsA,NsB,NsC,NsD,NtA,NtB,NtC,OtA,OtB,OtC,OtD,RsA,RsB,RsC,RsD,RtC(Troup),RtD(Troup)

03 - Map Units - AfF(Troup),BtB,Co,CrB,CrC,CsD,FmA,FmB,FmB2,FmC,GoA,GoB,Gu,Ha,KaA,KbA,KbB,KsB,LsF,LtF,Lw,LyA,LyB,LzA,LzB,MfB3,MfC3,MgA,MgA2,MgB,MgB2,MgC,MgC2,OfA,OfB,OfB2,OfC,OfC2,OfD,PcA,PhA,PhB,PsA,RbB3,RbC3,RbD3,ReA,ReB,ReB2,ReC,ReC2,RfC3,RmA,RmB,RmB2,RmC,RmC2,RmD,RtC(Orangeburg),RtF,RtF3,RuA,RbB,ShB,SrD,SrF, SsD,Sw

04 - Map Units - Ab,AfD(Nankin),AtF(Nankin),BaC,BcB,BfB,BfC,CaC3,CnA,CnB,CnB2,CnC,CnC2,CnD,CsF,FaC3,FaD3,FmC2,FmD,FsD,FsD3,FsF,FsF3,Gr,Ig,LeA,LeB,LtC(Nankin),LtD(Nankin),LtF(Nankin),Lv,MfD3,MgD,MyB,NfA,NfB,NfB2,NfC,NfC2,NfD,NpA,NpB,NpB2,PsB,Pt,Ra,ReD,RtD(Cowarts),SaB,SaC,SnB,SnC,SsF,TfA,TfB,TfB2,TfC2,ZuB,ZuC

Nontechnical Soil Descriptions

1o1 Map Units FmA, KaA, MgA, MgA2, OfA, ReA, RmA

"aSOI", "1o1", "This map unit consists of nearly level, well drained soils on uplands. They have sandy or loamy surface layers less than 20 inches thick, and moderately permeable loamy subsoil layers. These soils are prime farmland."

"bSAC", "1o1", "These soils have a well aerated root zone more than 60 inches thick. The available water capacity averages moderate to high in the root zone. They have moderate natural fertility and crops respond well to fertilization. Rainfall is readily absorbed and retained by the soils. Runoff during rains is slow and the erosion hazard is slight."

"cH2O", "1o1", "In normal years these soils have no seasonal high water table within 72 inches."

"dCUL", "1o1", "These soils have few limitations for growing cultivated crops. A wide variety of cultivated crops are well adapted. Such crops as corn, soybeans, peanuts, and tobacco grow well without special erosion control or water control measures. Practices such as good seedbed preparation, nutrient management, and crop rotation are all that are needed to keep the soil in good condition. Cover crops should be alternated with row crops. All crop residues should be returned to the soil."

"eERO", "1o1", "Crops produced on these soils do not normally need special erosion control practices."

"fIRR", "1o1", "Successful crop production on these soils does not normally require irrigation, however irrigation is necessary to insure against significant yield loss during periods of drought."

"hPAS", "1o1", "These soils are well suited to pastures and hay crops. Pasture grasses such as hybrid bermudagrass and the improved bahiagrasses are well adapted. Clovers and other legumes are also adapted. They grow well where they are properly managed. They require nutrient management and controlled grazing to maintain vigorous plants for highest yields and good soil cover."

"iWMG", "1o1", "Water table management is not needed on these soils."

1o2 Map Units CnA, NfA, NpA, TfA

"aSOI", "1o2", "This map unit consists of nearly level, well drained soils on uplands. They have sandy surface layers less than 20 inches thick, and moderately slowly permeable loamy subsoil layers. These soils are prime farmland."

"bSAC", "1o2", "The root zone is restricted by a compact subsoil and by slight wetness in wet seasons. These soils have moderate natural fertility and crops respond well to fertilization. The available water capacity averages moderate to high in the root zone. Rainfall is readily absorbed and retained by the soils. Runoff during rains is slow and the hazard of erosion is slight."

"cH2O", "1o2", "In normal years these soils have a seasonal high water table at a depth of between 36 and 48 inches for 1 to 4 months. In other months the water table is below these depths. Rarely, only briefly during periods of high rainfall, is the water table above the normal seasonal high water table depth."

"dCUL", "1o2", "These soils have few limitations for growing cultivated crops. The variety of cultivated crops is somewhat limited by wetness. Such crops as corn, soybeans, and peanuts grow well without special conservation practices. Practices such as good seedbed preparation, nutrient management, and crop rotations are all that are needed to keep the soil in good condition. Cover crops should be alternated with row crops. All crop residues should be returned to the soil."

"eERO", "1o2", "Crops produced on these soils do not normally need special erosion control practices."

"fIRR", "1o2", "Crops produced are not normally irrigated."

"hPAS", "1o2", "These soils are well suited to pastures and hay crops. Pasture grasses such as hybrid bermudagrass and improved bahiagrasses are well adapted. Clovers and other legumes are also adapted. Grasses and clovers grow well where they are properly managed. They require nutrient management and controlled grazing to maintain vigorous plants for highest yields and good soil cover."

"iWMG", "1o2", "Water table management is not needed on these soils."

2e1 Map Units CrB, FmB, MgB, OfB, ReB, RmB

"aSOI", "2e1", "This map unit consists of gently sloping, well drained soils of the uplands. They have sandy or loamy surface layers less than 20 inches thick, and moderately permeable, loamy or clayey subsoil layers. These soils are prime farmland."

"bSAC", "2e1", "These soils have a well aerated root zone more than 60 inches thick. The available water capacity averages moderate to high in the root zone. These soils have moderate natural fertility and crops respond well to fertilization. Rainfall is readily absorbed and retained in the soil. Runoff during rain is moderate to rapid on unprotected areas and the erosion hazard is moderate."

"cH2O", "2e1", "In normal years these soils have no seasonal high water table within 72 inches."

"dCUL", "2e1", "These soils have moderate limitations for growing cultivated crops because of the hazard of erosion. A wide variety of cultivated crops is well adapted. Such crops as corn and soybeans grow well where properly managed. Moderate erosion control measures are needed. Maximum yields require good seed-soil contact, fertilizing, and liming. Nutrient management maximize yields."

"eERO", "2e1", "Moderate erosion control measures are needed on these soils. These include a system of well-designed terraces with stabilized outlets and contour cultivation of row crops in alternate strips with cover crops. Crop rotations are needed that include cover crops at least half the time. Soil-Improving cover crops and all crop residues should be left on the soil. Conservation tillage or no-till best protect the soil."

"fIRR", "2e1", "Crops produced on these soils are not normally irrigated."

"hPAS", "2e1", "These soils are well suited to pastures and hay crops. Pasture grasses such as hybrid bermudagrass and the improved bahiagrasses are well adapted. Clovers and other legumes are also adapted. They grow well where properly managed. They require nutrient management and controlled grazing to maintain vigorous plants for highest yields and good soil cover."

"iWMG", "2e1", "Water table management is not normally practiced on these soils."

2e2 Map Units CnB, NfB, NpB, TfB

"aSOI", "2e2", "This map unit consists of gently sloping, well drained to moderately well drained soils on uplands. They have sandy or loamy surface layers less than 20 inches thick, and moderately slowly permeable loamy subsoil layers. These soils are prime farmland."

"bSAC", "2e2", "These soils have a root zone that is somewhat restricted by a compact subsoil and by slight wetness in wet seasons. The available water capacity in the root zone averages moderate. Natural fertility is low but crops respond moderately well to fertilization. The internal drainage rate is slow under natural conditions. Runoff during rains is moderate on unprotected areas and the hazard of erosion is moderate."

"cH2O", "2e2", "In normal years these soils have a seasonal high water table at a depth of between 36 and 48 inches for 1 to 4 months. In other months the water table is below these depths. Rarely, only during periods of high rainfall and only for a few days is the water table above the normal seasonal high water table depth."

"dCUL", "2e2", "These soils have moderate limitations for growing cultivated crops due to the hazard of erosion. The variety of cultivated crops is somewhat limited by wetness. Crops such as corn and peanuts are adapted where properly managed. Moderate erosion control measures are needed. Maximum yields require good seedbed preparation and nutrient management."

"eERO", "2e2", "Moderate erosion control measures are needed on these soils. These include a system of well-designed terraces with stabilized outlets and contour cultivation of row crops in alternate strips with cover crops. Crop rotations are needed that include cover crops at least half the time. Soil improving cover crops and all crop residues should be left on the soil. Conservation tillage or no-till best protect the soil."

"fIRR", "2e2", "Crops produced on these soils are not normally irrigated."

"hPAS", "2e2", "These soils are well suited to pastures and hay crops. Improved pasture plants such as clovers, hybrid bermudagrass, and improved bahiagrasses are well adapted. They produce well where they are properly managed. They require nutrient management and controlled grazing to maintain vigorous plants and a good ground cover."

"iWMG", "2e2", "Water table management is not normally practiced on these soils; however, tile drains are needed to maintain good drainage for such crops as tobacco."

2e4 Map Units GoB, LyB, SaB, ZuB

"aSOI", "2e4", "This map unit consists of gently sloping, moderately well drained soils on terraces and uplands. They have sandy surface layers less than 20 inches thick, and moderately slowly or slowly permeable loamy or clayey subsoils. These soils are prime farmland."

"bSAC", "2e4", "The root zone is limited by a seasonal high water table. The available water capacity is moderate in the root zone. Natural fertility is low, but crops respond well to fertilization. Internal drainage rate is slow, but the soils respond well to artificial drainage. Some drainage or a raised seedbed is needed for highest yields of most crops. Rainfall runoff from unprotected areas is moderate and the hazard of erosion is moderate."

"cH2O", "2e4", "In normal years these soils have a seasonal high water table at a depth of between 18 and 36 inches for 1 to 4 months. In other months the water table is below these depths. Rarely, only during periods of high rainfall and only for a few days, is the water table above the normal seasonal high water table depth."

"dCUL", "2e4", "These soils have moderate limitations for cultivated crops because of the hazard of erosion. The variety of crops that are well adapted is somewhat limited by occasional wetness. Such crops as corn, soybeans, and peanuts grow moderately where properly managed. Moderate erosion control measures are needed. Maximum yields require proper seedbeds and nutrient management. Tile drains to remove water during wet seasons are needed for crops such as tobacco."

"eERO", "2e4", "Moderate erosion control measures are needed on these soils. These include a system of well-designed terraces with stabilized outlets and contour cultivation of row crops in alternate strips with cover crops. Crop rotations are needed that include cover crops at least half the time. Soil improving cover crops and all crop residues should be left on the soil. Conservation tillage or no-till best protect the soil."

"hPAS", "2e4", "These soils are well suited to improved pastures and hay crops. Clovers, hybrid bermudagrass, and bahiagrasses are well adapted. They grow well where nutrient management is practiced. Controlled grazing is needed to maintain vigorous plants for maximum yields and a good ground cover."

"iWMG", "2e4", "Ditches and/or tile drains, to remove excess surface water during rains, are needed to prevent crop damage for most crops produced on these soils. Some crops require more intensive water control measures. Tile drains can also be used to provide supplemental water through subirrigation."

2e5 Map Unit LeB

"aSOI", "2e5", "This map unit consists of gently sloping, somewhat poorly drained soils on uplands. They have sandy surface layers 20 to 40 inches thick, and moderately slowly permeable loamy subsoil layers."

"bSAC", "2e5", "A well aerated root zone is limited by a seasonal high water table. The available water capacity averages low to moderate in the root zone. The soils have low natural fertility but crops respond well to fertilization. Runoff is moderate on unprotected areas and the hazard of erosion is slight to moderate."

"cH2O", "2e5", "In normal years these soils have a seasonal high water table at a depth of between 18 and 36 inches for 1 to 4 months. In other months the water table is below these depths. Rarely, only during periods of high rainfall and only for a few days, is the water table above the normal seasonal high water table depth."

"dCUL", "2e5", "These soils have moderate limitations for cultivated crops because of the hazard of erosion. The variety of crops that grow well is limited to those that are tolerant of slightly wet conditions. Such crops as corn, soybeans, and peanuts grow moderately where properly managed. Moderate erosion control measures are needed. Maximum yields require proper seedbeds. Tile drains to remove water during wet seasons are needed for crops such as tobacco. Nutrient management maximize yields."

"eERO", "2e5", "Moderate erosion control measures are needed on these soils. These include a system of well-designed terraces with stabilized outlets and contour cultivation of row crops in alternate strips with cover crops. Crop rotations are needed that include cover crops at least half the time. Soil improving cover crops and all crop residues should be left on the soil. Conservation tillage or no-till best protect the soil."

"fIRR", "2e5", "Crops produced on these soils are not normally irrigated."

"hPAS", "2e5", "These soils are well suited to pastures and hay crops. Clovers, hybrid bermudagrass, and bahiagrass are well adapted. They produce moderate yields where nutrient management is practiced. Controlled grazing is needed to maintain vigorous plants for maximum yields and good cover."

"iWMG", "2e5", "Ditches and/or tile drains, to remove excess surface water during rains, are needed to prevent crop damage for most crops produced on these soils. Some crops such as tobacco require more intensive water control measures. Tile drains can also be used to provide supplemental water through subirrigation."

2s1 Map Units EsA, EsB, OtA, OtB, RsA, RsB

"aSOI", "2s1", "This map unit consists of nearly level and gently sloping, well drained soils on uplands. They have sandy surface and subsurface layers 20 to 40 inches thick, and moderately to moderately rapidly permeable loamy subsoil layers."

"bSAC", "2s1", "These soils have a well aerated root zone more than 72 inches thick. The available water capacity averages low to moderate in the root zone. Natural fertility is low and crop response to fertilization is moderate. Rainfall is rapidly absorbed with little runoff. The erosion hazard is slight."

"cH2O", "2s1", "In normal years these soils have no seasonal high water table within 72 inches."

"dCUL", "2s1", "These soils have moderate limitations for cultivated crops due to droughtiness. They can be cultivated safely with ordinary farming methods, but droughtiness and rapid leaching of plant nutrients limit the choice of crops and the potential yields of adapted crops. With good management such crops as corn, soybeans, peanuts, and tobacco can be grown. Yields can be maximized with nutrient management."

"eERO", "2s1", "Row crops should be planted on the contour in alternate strips with cover crops. Crop rotations should include cover crops at least half the time. These cover crops and all residues of other crops should be returned to the soil."

"fIRR", "2s1", "Crops produced on these soils are not normally irrigated and good yields can be achieved without irrigation but yields can be increased with irrigation. Irrigation of some high value crops such as tobacco is usually feasible where irrigation water is readily available."

"hPAS", "2s1", "These soils are well suited to pastures. Deep rooting plants such as hybrid bermudagrass and bahiagrass are well adapted. They produce well where nutrient management is practiced. Controlled grazing is important to maintain vigorous plants for maximum yields and good cover."

"iWMG", "2s1", "Water table management is not normally practiced on these soils."

2s2 MAP UNITS GmA, GmB, NsA, NsB, NtA, NtB

aSOI", "2s2", "This map unit consists of nearly level and gently sloping, well drained to moderately well drained soils on uplands. They have sandy surface and subsurface layers 20 to 40 inches thick, and moderately slowly to slowly permeable loamy and clayey subsoil layers."

"bSAC", "2s2", "These soils have a well aerated root zone that is limited at about 45 inches by slowly permeable subsoils or by wetness. The available water capacity averages low to moderate in the root zone. Natural fertility is low and crop response to fertilization is moderate. Rainfall is rapidly absorbed with little runoff. The erosion hazard is slight."

"cH2O", "2s2", "In normal years these soils have a seasonal high water table at a depth of between 36 and 48 inches for 1 to 4 months. In other months the water table is below these depths. Rarely, only during periods of high rainfall and only for a few days, is the water table above the normal seasonal high water table depth."

"dCUL", "2s2", "These soils have moderate limitations for cultivated crops due to droughtiness during dry seasons and wetness during wet seasons. They can be cultivated safely with ordinary good farming methods, but droughtiness and rapid leaching of plant nutrients limit the choice of crops and the potential yields of adapted crops. With good management such crops as corn, soybeans, peanuts and tobacco can be grown. Nutrient management maximizes yields."

"eERO", "2s2", "Row crops should be planted on the contour in alternate strips with cover crops. Crop rotations should include cover crops at least half the time. Soil improving cover crops and all residues of other crops should be left on the field."

"fIRR", "2s2", "Crops produced on these soils are not normally irrigated; however, yields can be increased with irrigation. Irrigation is feasible where water is readily available."

"hPAS", "2s2", "These soils are well suited to pastures. Hybrid bermudagrass and bahiagrasses are well adapted. They produce well where nutrient management is practiced. Controlled grazing is needed to maintain vigorous plants for maximum yields and good cover."

"iWMG", "2s2", "Water table management is not normally practiced on these soils."

2s3 Map Units LeA, LeB

"aSOI", "2s3", "This map unit consists of nearly level, somewhat poorly drained soils on uplands. They have sandy surface and subsurface layers 20 to 40 inches thick, and moderately slowly permeable loamy subsoil layers."

"bSAC", "2s3", "A well aerated root zone is limited by a seasonal high water table in wet seasons. The available water capacity averages low to moderate in the root zone. Natural fertility is low, but crops respond well to fertilization. The internal drainage rate under natural conditions is slow and response to artificial drainage is moderately slow."

"cH2O", "2s3", "In normal years these soils have a seasonal high water table at a depth of between 18 and 36 inches for 1 to 4 months. In other months the water table is below these depths. Rarely, only during periods of high rainfall and only for a few days is the water table above the normal seasonal high water table depth."

"dCUL", "2s3", "These soils have moderate limitations for cultivated crops due to wetness and the hazard of erosion. With conservation practices that include erosion control and water table management, they are suited to a wide variety of cultivated crops. Nutrient management maximizes yields."

"eERO", "2s3", "Moderate erosion control measures that include crop rotations are needed. These measures should provide cover crops on the land at least half the time. Soil improving cover crops and all crop residues should be left on the land."

"hPAS", "2s3", "These soils are well suited to pastures. Grasses such as hybrid bermudagrass and bahiagrasses grow well when well managed. White clovers and other legumes are moderately adapted. Best yields require nutrient management and carefully controlled grazing to maintain plant vigor."

"iWMG", "2s3", "Ditches and/or tile drains, to remove excess surface water during rains, are needed to prevent crop damage for most crops produced on these soils. Some crops such as tobacco require more intensive water control measures. Tile drains can also be used to provide supplemental water through subirrigation."

2w1 Map Unit GoB

"aSOI", "2w1", "This map unit consists of nearly level moderately well drained soils on uplands. They have sandy or loamy surface layers less than 20 inches thick, and moderately permeable, loamy subsoil layers. These soils are prime farmland."

"bSAC", "2w1", "A well aerated root zone is slightly limited by a seasonal high water table in wet seasons. The soils have a moderate available water capacity in the root zone. Natural fertility is low and crops respond moderately well to fertilization. The internal drainage rate under natural conditions is slow and response to artificial drainage is moderate."

"cH2O", "2w1", "In normal years these soils have a seasonal high water table at a depth of between 18 and 36 inches for 1 to 4 months. In other months the water table is below these depths. Rarely, only during periods of high rainfall and only for a few days, is the water table above the normal seasonal high water table depth."

"dCUL", "2w1", "These soils have moderate limitations for growing cultivated crops. The variety of adapted cultivated crops is somewhat limited by occasional wetness. Crops such as corn and peanuts are adapted when they are properly managed. Crop rotations should include cover crops on the land at least half the time. Crop residue should be left on the soil. Maximum yields require good seedbed preparation and nutrient management."

"eERO", "2w1", "Crops produced on these soils do not normally need special erosion control practices."

"fIRR", "2w1", "Crops produced on these soils are not normally irrigated."

"hPAS", "2w1", "These soils are well suited to pastures and hay crops. Improved pasture plants such as clovers, hybrid bermudagrass, and improved bahiagrass are well adapted. They grow well when they are well-managed. They require nutrient management and controlled grazing to maintain vigorous plants for highest yields."

"iWMG", "2w1", "Ditches and/or tile drains, to remove excess surface water during rains, are needed to prevent crop damage for most crops. Some crops such as tobacco require more intensive water control measures. Tile drains can also be used to supply water to plants during periods of low rainfall by subirrigation."

2w2 Map Unit Ig

"aSOI", "2w2", "This map unit consists of nearly level, moderately well drained soils on low ridges in the lowlands and upland flats. They have sandy or loamy surface layers less than 20 inches thick, and moderately slowly or slowly permeable loamy or clayey subsoil layers. These soils are prime farmland."

"bSAC", "2w2", "A well aerated root zone is limited by a seasonal high water table in wet seasons. The available water capacity is moderate within the root zone. Natural fertility is low, but crops respond well to fertilization. The internal drainage rate is slow under natural conditions, but the soils respond readily to artificial drainage. Drainage is needed for highest yields of most crops."

"cH2O", "2w2", "In normal years these soils have a seasonal high water table at a depth of between 18 and 36 inches for 1 to 4 months. In other months the water table is below these depths. Rarely, only during periods of high rainfall and only for a few days, is the water table above the normal seasonal high water table depth."

"dCUL", "2w2", "These soils have moderate limitations for cultivated crops because of wetness. Corn, peanuts, soybeans, and tobacco grow well where well managed. Cover crops should be rotated with row crops and crop rotations should include a cover crop at least half of the time. All crop residues should be left on the land. Other important management practices include good seedbed preparation and nutrient management."

"eERO", "2w2", "Crops produced on these soils do not normally need special erosion control practices."

"fIRR", "2w2", "Crops produced on these soils are not normally irrigated."

"hPAS", "2w2", "These soils are well suited to pastures and hay crops. Clovers, hybrid bermudagrass, and bahiagrasses are well adapted. These plants need nutrient management for highest yields. Grazing should be controlled to maintain vigorous plants for best yields."

"iWMG", "2w2", "These soils need a water table management system designed to remove excess water rapidly after heavy rains. Carefully designed tile or open drains are needed. Tile drains can also be used to supply water to plants during periods of low rainfall by subirrigation."

2w4 Map Unit LeA

"aSOI", "2w4", "This map unit consists of nearly level, moderately well drained and somewhat poorly drained soils on uplands. They have sandy surface and subsurface layers 20 to 40 inches thick and moderately permeable loamy subsoil layers."

"bSAC", "2w4", "A well aerated root zone is limited by a seasonal high water table in wet seasons. The available water capacity averages moderate in the root zone. Natural fertility is low, but the soils respond well to fertilization. Internal drainage rate is moderate, and the soils respond well to water table management. Water table management is needed for highest yields of some crops."

"cH2O", "2w4", "In normal years these soils have a seasonal high water table at a depth of between 18 and 36 inches for 1 to 4 months. In other months the water table is below these depths. Rarely, only during periods of high rainfall and only for a few days, is the water table above the normal seasonal high water table depth."

"dCUL", "2w4", "These soils have moderate limitations for cultivated crops due to wetness. In their natural condition the variety of adapted crops is limited to those such as corn and peanuts that are tolerant of slight wetness. Crop rotations should include close growing crops, on the land at least half the time. All crop residues should be left on the land. Best yields require good seedbed preparation and nutrient management."

"eERO", "2w4", "Crops produced on these soils do not normally need special erosion control practices."

"fIRR", "2w4", "Crops produced on these soils are not normally irrigated."

"hPAS", "2w4", "These soils are well suited to pastures and hay crops. Such grasses as hybrid bermudagrass and improved bahiagrasses grow well where well managed. Several legumes are also well adapted. These plants require nutrient management and controlled grazing for highest yields."

"iWMG", "2w4", "These soils need a water table management system designed to remove excess water rapidly after heavy rains. Carefully designed tile or open drains are needed. Tile drains can also be used to supply water to plants during periods of low rainfall by subirrigation."

2w5 Map Unit LyA

"aSOI", "2w5", "This map unit consists of nearly level, somewhat poorly drained soils on stream terraces and on interstream divides of the uplands. They have loamy surface layers less than 20 inches thick, and moderate or moderately slowly permeable subsoil layers."

"bSAC", "2w5", "A well aerated root zone is limited by a seasonal high water table in wet seasons. The available water capacity is low to moderate in the root zone. Natural fertility is low, but crops respond well to fertilization. The internal drainage is slow and response to artificial drainage is moderately slow."

"cH2O", "2w5", "In normal years these soils have a seasonal high water table at a depth of between 6 and 18 inches for 1 to 4 months. In other months the water table is below these depths. Rarely, only during periods of high rainfall and only for a few days, is the water table above the normal seasonal high water table depth."

"dCUL", "2w5", "These soils have moderate limitations for cultivated crops due to wetness. They are well suited to some cultivated crops but the variety is limited by the presence of a water table near the surface. Crop rotations should include a close-growing crop at least half the time. Soil improving cover crops and crop residues should be returned to the soil. High yields require good seedbed preparation with the rows bedded and nutrient management."

"eERO", "2w5", "Crops produced on these soils do not normally need special erosion control practices."

"fIRR", "2w5", "Crops produced on these soils are not normally irrigated."

"hPAS", "2w5", "These soils are well suited to pastures and hay crops. Such grasses as hybrid bermudagrass and the improved bahiagrasses are well adapted. White clover and other legumes are moderately well adapted. Best yields require nutrient management and carefully controlled grazing to maintain vigorous plants for maximum yields and good cover."

"iWMG", "2w5", "Water table management is needed for successful use of these soils for most cultivated crops. Crops such as corn, soybeans, and peanuts do well if a drainage system is maintained or crops are planted and harvested during periods of low rainfall. Tile drains or shallow surface ditches provide an adequate water management system. Tile drains can also supply water through subirrigation."

2w6 Map Unit Ha

"aSOI", "2w6", "This map unit consists of nearly level and gently sloping, well drained to moderately well drained soils in slight depressions on uplands. They have loamy layers more than 60 inches thick. These soils are prime farmland."

"bSAC", "2w6", "The root zone is unrestricted. The available water capacity is moderate to high. Natural fertility is moderate to high and the soils respond well to fertilization. Runoff from higher areas accumulates on some areas during heavy rains, but internal drainage is rapid and the water soon filters through the soil into underlying porous strata."

"cH2O", "2w6", "In normal years these soils have a seasonal high water table at a depth of between 18 and 36 inches for 1 to 4 months. In other months the water table is below these depths. Rarely, only during periods of high rainfall and only for a few days, is the water table above the normal seasonal high water table depth."

"dCUL", "2w6", "These soils are well suited to a wide variety of cultivated crops. They occur in slight depressions where soil accumulates from adjacent higher areas. They are usually small and appear as low places in larger fields. Drainage is rapid enough in most areas to permit growing the same crops that are grown on the adjacent soils. Better moisture relationships and higher productivity usually is evidenced by better plant growth with similar management on these areas."

"eERO", "2w6", "Crops produced on these soils do not normally need special erosion control practices."

"fIRR", "2w6", "Crops produced on these soils are not normally irrigated."

"hPAS", "2w6", "The soils are well suited to pastures and hay crops. Improved pasture plants such as clovers, hybrid bermudagrass, and improved bahiagrass are well adapted. They grow well when they are well managed. They require nutrient management and controlled grazing to maintain vigorous plants for highest yields."

"iWMG", "2w6", "Most areas of this soil requires tile drainage to remove surface water to reduce crop damage and to obtain maximum yields."

3e1 Map Units CrC, FmC, MgC, OfC, ReC, RmC, RtC

"aSOI", "3e1", "This map unit consists of sloping, well drained soils on side slopes of uplands. They have sandy or loamy surface layers less than 20 inches thick, and moderately permeable, loamy or clayey subsoil layers. These soils are prime farmland."

"bSAC", "3e1", "These soils have a well aerated root zone more than 60 inches thick. The available water capacity is moderate to high in the root zone. They have moderate natural fertility and crops respond well to fertilization. Rainfall is readily absorbed and retained in the soil. Runoff after rains is rapid on unprotected areas and the erosion hazard is severe."

"cH2O", "3e1", "In normal years these soils have no seasonal high water table within 72 inches."

"dCUL", "3e1", "These soils have severe limitations for growing cultivated crops because of the hazard of erosion. A wide variety of cultivated crops is well adapted. Such crops as corn and soybeans grow well when properly managed. Maximum yields require good soil tilth and nutrient management."

"eERO", "3e1", "Intensive erosion control measures are needed. These measures include a system of well designed terraces with stabilized outlets and contour cultivation of row crops in alternate strips with cover crops. Crop rotations are needed that include cover crops at least two-thirds of the time. Soil improving cover crops and all crop residues should be left on the soil. Conservation tillage or no-till best protect the soil."

"fIRR", "3e1", "Crops produced on these soils are not normally irrigated."

"hPAS", "3e1", "These soils are well suited to pastures and hay crops. Pasture grasses such as hybrid bermudagrass and the improved bahiagrasses are well adapted. Clovers and other legumes are also well adapted. They grow well where properly managed and require nutrient management and controlled grazing to maintain vigorous plants for highest yields and good soil cover to reduce the hazard of erosion."

"iWMG", "3e1", "Water table management is not normally practiced on these soils."

3e2 Map Units CnC, NfC, ZuC

"aSOI", "3e2", "This map unit consists of sloping, well drained to moderately well drained soils on low ridges of the uplands. They have sandy or loamy surface layers less than 20 inches thick, and moderately slowly to slowly permeable loamy subsoil layers."

"bSAC", "3e2", "A well aerated root zone is limited by compact subsoil layers at 30 to 50 inches below the surface. The available water capacity averages moderate to high in the root zone. Natural fertility is low and the crops respond only moderately to fertilization. Runoff during rains is rapid on unprotected areas and the hazard of erosion is severe."

"cH2O", "3e2", "In normal years these soils have a seasonal high water table at a depth of between 36 and 60 inches for 1 to 4 months. In other months the water table is below these depths. Rarely, only during periods of high rainfall and only for a few days, is the water table above the normal seasonal high water table depth."

"dCUL", "3e2", "These soils have severe limitations for cultivated crops due to the hazard of erosion. They are only moderately suited for most crops. The variety of adapted crops is somewhat limited by occasional wetness. Crops such as corn, soybeans, and peanuts are only moderately suited. Maximum yields require good soil tilth and nutrient management."

"eERO", "3e2", "Intensive erosion control measures are needed. Such measures include carefully designed terraces with stabilized outlets, contour cultivation of row crops grown in alternate strips with close growing crops, and crop rotations that include close growing crops on the land at least two-thirds of the time. Soil improving cover crops and all crop residues should be left on the land. Conservation tillage or no-till best protects the soil."

"fIRR", "3e2", "Crops produced on these soils are not normally irrigated."

"hPAS", "3e2", "The soils are only moderately suited to pastures. Hybrid bermudagrass and improved bahiagrasses are only moderately adapted. They produce only moderate yields where nutrient management is practiced. Controlled grazing is needed to maintain vigorous plants for maximum yields and good soil cover to control erosion."

"iWMG", "3e2", "Tile or open drains may be needed to intercept seepage water from higher areas."

3e3 Map Units ShB, SnB

"aSOI", "3e3", "This map unit consists of gently sloping, well drained or moderately well drained soils on side slopes of upland ridges. They have sandy surface layers less than 20 inches thick, and slowly permeable clayey or loamy subsoil layers."

"bSAC", "3e3", "The soils have a well aerated root zone 22 to 36 inches thick. It is limited by firm, slowly permeable subsoil. These soils have low natural fertility and crops have only fair response to fertilization. The available water capacity is moderate. Rainfall is readily absorbed into the soil, but slow permeability of the subsoil limits the amount that can be absorbed during any one heavy rain. Runoff from rain is rapid and the erosion hazard is severe."

"cH2O", "3e3", "In normal years these soils have no seasonal high water table within 72 inches."

"dCUL", "3e3", "These soils have severe limitations for cultivated crops because of the hazard of erosion. They are not well suited to most cultivated crops. They have only fair suitability for such crops as corn and soybeans. Maximum yields require good soil tilth and nutrient management."

"eERO", "3e3", "Intensive erosion control measures are needed. These measures should include well designed terraces with stabilized outlets. They should also include contour cultivation of row crops grown in alternate strips with close growing crops. Crop rotations should include close growing crops on the land at least two-thirds of the time. Soil building cover crops and all crop residues should be left on the land. Conservation tillage or no-till best protects the soil."

"fIRR", "3e3", "Crops produced on these soils are not normally irrigated."

"hPAS", "3e3", "The soils are well suited to pastures. Such plants as clovers, hybrid bermudagrass, and improved bahiagrasses are well adapted. They grow well where nutrient management is practiced. Controlled grazing is needed to maintain vigorous plants for maximum yields and good soil cover for erosion control."

"iWMG", "3e3", "Water table management is not normally practiced on these soils."

3e4 Map Unit SaC

"aSOI", "3e4", "This map unit consists of sloping, moderately well drained soils on terraces and uplands. They have sandy surface layers less than 20 inches thick, and moderately slowly or slowly permeable loamy or clayey subsoils."

"bSAC", "3e4", "The root zone is limited by a seasonal high water table. The available water capacity is moderate in the root zone. Natural fertility is low, but the soils respond well to fertilizers. Rainfall runoff from unprotected areas is rapid and the hazard of erosion is severe."

"cH2O", "3e4", "In normal years these soils have a seasonal high water table at a depth of between 18 and 36 inches for 1 to 4 months. In other months the water table is below these depths. Rarely, only during periods of high rainfall and only for a few days, is the water table above the normal seasonal high water table depth."

"dCUL", "3e4", "These soils have severe limitations for cultivated crops because of the hazard of erosion. The variety of crops that are well adapted is somewhat limited by occasional wetness. Such crops as corn, soybeans, and peanuts grow well where properly managed. Maximum yields require proper seedbeds. Tile drains to remove water during wet seasons are needed for crops such as tobacco. Nutrient management maximize yields."

"eERO", "3e4", "Intensive erosion control measures are needed on these soils. These include a system of well-designed terraces with stabilized outlets and contour cultivation of row crops in alternate strips with cover crops. Crop rotations are needed that include cover crops at least two-thirds of the time. Soil improving cover crops and all crop residues should be left on the soil. Conservation tillage or no-till best protect the soil."

"fIRR", "3e4", "Crops produced on these soils are not normally irrigated."

"hPAS", "3e4", "These soils are moderately well suited to improved pastures and hay crops. Clovers, hybrid bermudagrass, and bahiagrasses are well adapted. They grow well where they are fertilized and limed. Controlled grazing is needed to maintain vigorous plants for maximum yields and a good ground cover."

"iWMG", "3e4", "A water table management system that includes ditches to remove excess surface water during rains is needed to prevent crop damage for most crops produced on these soils. Some crops such as tobacco require more intensive water control measures including tile drains. Tile drains can also be used to provide supplemental water through subirrigation."

3e5 Map Units BtB, KsB, PhB

"aSOI", "3e5", "This map unit consists of nearly level and gently sloping, somewhat poorly drained soils on low ridges within the flatwoods and broad flats of the uplands. They have rapidly permeable sandy layers to depths of 30 to 70 inches over moderately to moderately rapidly permeable subsoil."

"bSAC", "3e5", "The root zone of these soils is limited by a seasonal high water table in wet seasons and by droughtiness during periods of low rainfall. The available water capacity is low in the root zone. Natural fertility is low but the response to fertilizers is moderate. Rainfall is rapidly absorbed and there is little runoff. The hazard of erosion is moderate on that part of the map unit between 2 to 5 percent slopes which has been assigned to this capability class."

"cH2O", "3e5", "In normal years these soils have a seasonal high water table at a depth of between 18 and 40 inches for 1 to 4 months. In other months the water table is below these depths. Rarely, only during periods of high rainfall and only for a few days, is the water table above the normal seasonal high water table depth."

"dCUL", "3e5", "These soils have severe limitations for most cultivated crops due to wetness in wet seasons, droughtiness during periods of low rainfall, rapid leaching of plant nutrients and the hazard of erosion on slopes greater than 2 percent. These factors also limit the choice of plants and reduces potential yields of adapted crops. Maximum yields require proper seedbeds and nutrient management. Soil improving cover crops and all crop residues should be left on the ground. Erosion control measures are needed on that part of the map unit between 2 to 5 percent slopes which has been assigned to this capability class."

"eERO", "3e5", "Erosion control measures are needed on these soils on slopes above 2 percent. These include contour cultivation of row crops in alternate strips with cover crops. Crop rotations are needed that include cover crops at least two-thirds of the time. Soil improving cover crops and all crop residues should be left on the soil. Conservation tillage or no-till best protect the soil."

"fIRR", "3e5", "Irrigation of high value crops is usually feasible where irrigation water is readily available."

"hPAS", "3e5", "These soils are moderately suited to pastures. Hybrid bermudagrass and bahiagrasses are adapted. White clover and lespedezas are also adapted. These soils produce good yields where nutrient management is practiced. Controlled grazing is needed to maintain vigorous plants for maximum yields."

"iWMG", "3e5", "Tile, or other types of drains, are needed for some crops such as tobacco that are damaged by high water table during the growing season. Tiles can also be used as a source for subirrigation during periods of low rainfall."

3e9 Map Units CnB2, NfB2, NpB2, TfB2

"aSOI", "3e9", "This map unit consists of gently sloping, well drained to moderately well drained soils on low ridges of the uplands. They have sandy or loamy surface layers less than 20 inches thick, and moderately slowly to slowly permeable loamy subsoil layers and are eroded."

"bSAC", "3e9", "A well aerated root zone is limited by compact subsoil layers at 30 to 50 inches below the surface. The available water capacity averages moderate to high in the root zone. Natural fertility is low and the crops respond only moderately to fertilization. Runoff during rains is rapid on unprotected areas and the hazard of additional erosion is severe."

"cH2O", "3e9", "In normal years these soils have a seasonal high water table at a depth of between 36 and 60 inches for 1 to 4 months. In other months the water table is below these depths. Rarely, only during periods of high rainfall and only for a few days, is the water table above the normal seasonal high water table depth."

"dCUL", "3e9", "These eroded soils have severe limitations for cultivated crops due to the hazard of additional erosion. They are only moderately suited for most crops. The variety of adapted crops is somewhat limited by occasional wetness. Crops such as corn, soybeans, and peanuts are only moderately suited. Maximum yields require good soil tilth and nutrient management."

"eERO", "3e9", "Intensive erosion control measures are needed. Such measures include carefully designed terraces with stabilized outlets, contour cultivation of row crops grown in alternate strips with close growing crops, and crop rotations that include close growing crops on the land at least two-thirds of the time. Soil improving cover crops and all crop residues should be left on the land. Conservation tillage or no-till best protects the soil."

"fIRR", "3e9", "Crops produced on these soils are not normally irrigated."

"hPAS", "3e9", "The soils are only moderately suited to pastures. Hybrid bermudagrass and improved bahiagrasses are only moderately adapted. They produce only moderate yields where nutrient management is practiced. Controlled grazing is needed to maintain vigorous plants for maximum yields and good soil cover to control erosion."

"iWMG", "3e9", "Tile or open drains may be needed to intercept seepage water from higher areas."

3e20 Map Units FmB2, MfB3, MgB2, OfB2, RbB3, ReB2, RmB2

"aSOI", "3e20", "This map unit consists of gently sloping, well drained soils on side slopes of uplands. They have sandy or loamy surface layers less than 20 inches thick, and moderately permeable, loamy or clayey subsoil layers and are eroded."

"bSAC", "3e20", "The soils have a well aerated root zone more than 60 inches thick. The available water capacity is moderate to high in the root zone. They have moderate natural fertility and crops respond well to fertilization. Rainfall is readily absorbed and retained in the soil. Runoff after rains is rapid on unprotected areas and the erosion hazard is severe."

"cH2O", "3e20", "In normal years these soils have no seasonal high water table within 72 inches."

"dCUL", "3e20", "These eroded soils have severe limitations for growing cultivated crops because of the hazard of erosion. A wide variety of cultivated crops is well adapted. Such crops as corn and soybeans grow well when properly managed. Maximum yields require good soil tilth and nutrient management."

"eERO", "3e20", "Intensive erosion control measures are needed. These measures include a system of well designed terraces with stabilized outlets and contour cultivation of row crops in alternate strips with cover crops. Crop rotations are needed that include cover crops at least two-thirds of the time. Soil improving cover crops and all crop residues should be left on the soil. Conservation tillage or no-till best protect the soil."

"fIRR", "3e20", "Crops produced on these soils are not normally irrigated."

"hPAS", "3e20", "These soils are well suited to pastures and hay crops. Pasture grasses such as hybrid bermudagrass and the improved bahiagrasses are well adapted. Clovers and other legumes are also well adapted. They grow well where properly managed. They require nutrient management and controlled grazing to maintain vigorous plants for highest yields and good soil cover to reduce the hazard of erosion."

"iWMG", "3e20", "Water table management is not normally practiced on these soils. "

3e21 Map Unit LtC(Nankin)

"aSOI", "3e21", "This map unit consists of sloping, well drained or moderately well drained soils on side slopes of upland ridges. They have sandy surface layers less than 20 inches thick, and slowly permeable clayey or loamy subsoil layers."

"bSAC", "3e21", "The soils have a well aerated root zone 22 to 36 inches thick. It is limited by firm, slowly permeable subsoil. These soils have low natural fertility and crops have only fair response to fertilization. The available water capacity is moderate. Rainfall is readily absorbed into the soil, but slow permeability of the subsoil limits the amount that can be absorbed during any one heavy rain. Runoff from rain is rapid and the erosion hazard is severe."

"cH2O", "3e21", "In normal years these soils have no seasonal high water table within 72 inches."

"dCUL", "3e21", "These soils have severe limitations for cultivated crops because of the hazard of erosion. They are not well suited to most cultivated crops. They have only fair suitability for such crops as corn and soybeans. Maximum yields require good soil tillage and nutrient management."

"eERO", "3e21", "Intensive erosion control measures are needed. These measures should include well designed terraces with stabilized outlets. They should also include contour cultivation of row crops grown in alternate strips with close growing crops. Crop rotations should include close growing crops on the land at least two-thirds of the time. Soil building cover crops and all crop residues should be left on the land. Conservation tillage or no-till best protects the soil."

"fIRR", "3e21", "Crops produced on these soils are not normally irrigated."

"hPAS", "3e21", "The soils are well suited to pastures. Such plants as clovers, hybrid bermudagrass, and improved bahiagrasses are well adapted. They grow well where nutrient management is practiced. Controlled grazing is needed to maintain vigorous plants for maximum yields and good soil cover for erosion control."

"iWMG", "3e21", "Water table management is not normally practiced on these soils."

3s1 Map Units EsC, OtC, RsC

"aSOI", "3s1", "This map unit consists of sloping, well drained soils on side slopes of the uplands. They have sandy surface and subsurface layers 20 to 40 inches thick, and moderately to moderately rapidly permeable loamy subsoil layers."

"bSAC", "3s1", "These soils have a well aerated root zone more than 72 inches thick. The available water capacity averages low to moderate in the root zone. Natural fertility is low and crop response to fertilization is moderate. Rainfall is rapidly absorbed on well vegetated areas. Runoff from unprotected areas is moderate and the hazard of erosion on these areas is moderate."

"cH2O", "3s1", "In normal years these soils have no seasonal high water table within 72 inches."

"dCUL", "3s1", "These soils have severe limitations for cultivated crops due to droughtiness and erosion. Droughtiness and rapid leaching of plant nutrients limit the choice of crops and the potential yields of adapted crops. The steepness of slopes further limits the suitability by making cultivation more difficult and increasing the hazard of erosion. Yields can be maximized with nutrient management."

"eERO", "3s1", "Intensive erosion control measures such as cultivating row crops on the contour in alternate strips with cover crops are needed. Crop rotations should include cover crops at least two-thirds of the time. These cover crops and all residues of other crops should be returned to the soil."

"fIRR", "3s1", "Irrigation of some high value crops is usually feasible where irrigation water is readily available."

"hPAS", "3s1", "These soils are moderately well suited to pastures. Deep rooting plants such as hybrid bermudagrass and bahiagrass are well adapted. They produce well where nutrient management is practiced. Controlled grazing is important to maintain vigorous plants for maximum yields and to provide good cover to minimize erosion."

"iWMG", "3s1", "Water table management is not normally practiced on these soils."

3s2 Map Units GmC, LmC, NsC, NtC

aSOI", "3s2", "This map unit consists of sloping, well or moderately well drained soils on low ridges. They have sandy surface and subsurface layers that are 20 to 40 inches thick, and moderately slowly permeable to slowly permeable loamy and clayey subsoil layers."

"bSAC", "3s2", "These soils have a well aerated root zone that is limited at about 45 inches by slowly permeable subsoils or by wetness. The available water capacity averages low to moderate in the root zone. Natural fertility is low and crop response to fertilization is moderate. Rainfall is rapidly absorbed on well vegetated areas. Runoff from unprotected areas is moderate and the hazard of erosion on these areas is moderate."

"cH2O", "3s2", "In normal years these soils have a seasonal high water table at a depth of between 36 and 48 inches for 1 to 4 months. In other months the water table is below these depths. Rarely, only during periods of high rainfall and only for a few days, is the water table above the normal seasonal high water table depth."

"dCUL", "3s2", "These soils have severe limitations for cultivated crops due to droughtiness and erosion. Droughtiness and rapid leaching of plant nutrients limit the choice of crops and the potential yields of adapted crops. The steepness of slopes further limits the suitability by making cultivation more difficult and increasing the hazard of erosion. Yields can be maximized with nutrient management."

"eERO", "3s2", "Intensive erosion control measures such as cultivating row crops on the contour and in alternate strips with cover crops are needed. Crop rotations should include cover crops at least two-thirds of the time. These cover crops and all residues of other crops should be returned to the soil."

"fIRR", "3s2", "Irrigation of some high value crops such as tobacco is usually feasible where irrigation water is readily available."

"hPAS", "3s2", "These soils are moderately well suited to pastures. Hybrid bermudagrass and bahiagrasses are well adapted but yields are reduced during periodic droughts. They produce well where nutrient management is practiced. Controlled grazing is needed to maintain vigorous plants for maximum yields, minimize the effects of droughts and to maintain good ground cover to minimize erosion."

"iWMG", "3s2", "Water table management is not normally practiced on these soils."

3s3 Map Units AdB, BcB, BfB, KcB

"aSOI", "3s3", "This map unit consists of nearly level and gently sloping, well drained or moderately well drained soils of the uplands. The soils have sandy surface and subsurface layers 40 or more inches thick, and moderately to moderately rapidly permeable loamy subsoil layers."

"bSAC", "3s3", "The root zone of these soils is limited by droughtiness and somewhat by a seasonal high water table in wet seasons. Available water capacity averages very low to low in the root zone. Natural fertility is low and crop response to fertilization is moderate. Rainfall is rapidly absorbed and there is little runoff. The hazard of erosion is slight."

"cH2O", "3s3", "In normal years these soils have a seasonal high water table at a depth of between 40 and 60 inches for 1 to 4 months. In other months the water table is below these depths. Rarely, only during periods of high rainfall and only for a few days, is the water table above the normal seasonal high water table depth."

"dCUL", "3s3", "These soils have severe limitations for cultivated crops. Droughtiness and rapid leaching of plant nutrients reduce the number of well adapted crops and the potential yields of plants that are adapted. The control of erosion is also a management concern. Nutrient management maximizes yields."

"eERO", "3s3", "Some erosion control measures are needed such as cultivating row crops on the contour and in strips alternating with close growing, soil building crops. Crop rotations should include close growing, soil improving crops on the land at least two-thirds of the time. Soil building cover crops and all crop residues should be left on the land."

"fIRR", "3s3", "Irrigation of some high value crops is usually feasible where irrigation water is readily available."

"hPAS", "3s3", "These soils are poorly suited to pastures and hay crops. The soils are so droughty and have such low nutrient holding capacity that most grasses make only fair growth when carefully managed. Deep rooting hybrid bermudagrass and bahiagrasses are best adapted. They require nutrient management and carefully controlled grazing to maintain vigorous plants."

"iWMG", "3s3", "Water table management is not normally practiced on these soils. "

3s20 Map Units EcB, EmB

"aSOI", "3s20", "This map unit consists of gently sloping, well drained soils on upland ridges. They have sandy surface and subsurface layers that are 40 to 80 inches thick, and moderately permeable loamy subsoil layers."

"bSAC", "3s20", "These soils have a well aerated root zone that is not limited above a depth of about 72 inches. The available water capacity averages low to moderate in the root zone. Natural fertility is low and crop response to fertilization is moderate. Rainfall is rapidly absorbed on well vegetated areas. Runoff from unprotected areas is slight and the hazard of erosion on these areas is slight to moderate."

"cH2O", "3s20", "In normal years these soils do not have a seasonal high water table within a depth of 72 inches."

"dCUL", "3s20", "These soils have severe limitations for cultivated crops due to droughtiness. Droughtiness and the rapid leaching of plant nutrients limit the choice of crops and the potential yields of adapted crops. Yields can be maximized with nutrient management. Crop rotations should include cover crops at least two-thirds of the time. These cover crops and all residues of other crops should be returned to the soil."

"eERO", "3s20", "Moderate erosion control measures such as cultivating row crops on the contour and in alternate strips with cover crops are needed."

"fIRR", "3s20", "Irrigation of some high value crops is usually feasible where irrigation water is readily available."

"hPAS", "3s20", "These soils are moderately well suited to pastures. Hybrid bermudagrass and bahiagrasses are well adapted but yields are reduced during periodic droughts. They produce well where nutrient management is practiced. Controlled grazing is needed to maintain vigorous plants for maximum yields, minimize the effects of droughts and to maintain good ground cover to minimize erosion."

"iWMG", "3s20", "Water table management is not normally practiced on these soils."

3s21 Map Units LaB, LcB, LdB, LnB

"aSOI", "3s21", "This map unit consists of sloping, well drained soils on upland ridges. They have sandy surface and subsurface layers that are 40 to 80 inches thick, and moderately permeable loamy subsoil layers."

"bSAC", "3s21", "These soils have a well aerated root zone that is limited by a seasonal high water table in wet season and droughtiness during periods of low rainfall. The available water capacity averages low to moderate in the root zone. Natural fertility is low and crop response to fertilization is moderate. Rainfall is rapidly absorbed on well vegetated areas. Runoff from unprotected areas is slight and the hazard of erosion on these areas is slight to moderate."

"cH2O", "3s21", "In normal years these soils have a seasonal high water table at a depth of between 48 and 72 inches for 1 to 4 months. In other months the water table is below these depths. Rarely, only during periods of high rainfall and only for a few days, is the water table above the normal seasonal high water table depth."

"dCUL", "3s21", "These soils have severe limitations for cultivated crops due to droughtiness. Droughtiness and the rapid leaching of plant nutrients limit the choice of crops and the potential yields of adapted crops. Yields can be maximized with nutrient management. Crop rotations should include cover crops at least two-thirds of the time. These cover crops and all residues of other crops should be returned to the soil."

"eERO", "3s21", "Moderate erosion control measures such as cultivating row crops on the contour in alternate strips with cover crops are needed."

"fIRR", "3s21", "Irrigation of some high value crops such as tobacco is usually feasible where irrigation water is readily available."

"hPAS", "3s21", "These soils are moderately well suited to pastures. Hybrid bermudagrass and bahiagrasses are well adapted but yields are reduced during periodic droughts. They produce well where nutrient management is practiced. Controlled grazing is needed to maintain vigorous plants for maximum yields, minimize the effects of droughts and to maintain good ground cover to minimize erosion."

"iWMG", "3s21", "Water table management is not normally practiced on these soils."

3s22 Map Units Ab(Bigbee), HcB

"aSOI", "3s22", "This map unit consists of nearly level and gently sloping, somewhat poorly drained to well drained soils on flood plains broad. These soils are occasionally flooded. They have sandy layers that are rapidly permeable to depths of more than 20 inches."

"bSAC", "3s22", "The root zone of these soils is limited by a seasonal high water table in wet seasons as well as droughtiness during periods of low rainfall. The available water capacity is low to very low in all layers. Natural fertility is low and crop response to fertilization is moderate to low. Rainfall is rapidly absorbed and there is little runoff. The hazard of erosion is slight."

"cH2O", "3s22", "In normal years these soils have a seasonal high water table at a depth of between 40 and 60 inches for 1 to 4 months. In other months the water table is below these depths. Rarely, only during periods of high rainfall and only for a few days, is the water table above the normal seasonal high water table depth. They are occasionally flooded for periods of brief duration"

"dCUL", "3s22", "These soils have severe limitations for cultivated crops. Droughtiness, flooding, and the rapid leaching of plant nutrients limit the choice of plants and reduces potential yields of adapted crops. If cropped, soil management should include row crops on the contour in alternate strips with close growing crops. Crop rotations should include close growing crops on the land at least two-thirds of the time. Nutrient management maximize yields. Soil improving cover crops and all crop residues should be left on the land."

"eERO", "3s22", "Crops produced on these soils do not normally need special erosion control practices."

"fIRR", "3s22", "Irrigation of high value crops is usually feasible where irrigation water is readily available."

"hPAS", "3s22", "These soils are only moderately suited to pastures and hay. Plants such as hybrid bermudagrass and bahiagrasses are adapted. These soils require nutrient management to maximize yields. Controlled grazing is needed to maintain vigorous plants for maximum yields."

"iWMG", "3s22", "Water table management is not normally practiced on these soils."

3w7 Map Units KbA, KbB, LzA, LzB, PcA, PhA, RbB

"aSOI", "3w7", "This map unit consists of nearly level and gently sloping, somewhat poorly drained soils on low ridges within the flatwoods and broad flats of the uplands. They have rapidly permeable sandy layers to depths of 20 to 70 inches over moderately to moderately rapidly permeable subsoil."

"bSAC", "3w7", "The root zone of these soils is limited by a seasonal high water table in wet seasons and by droughtiness during periods of low rainfall. The available water capacity is low in the root zone. Natural fertility is low but the response to fertilizers is moderate. Rainfall is rapidly absorbed and there is little runoff. The hazard of erosion is moderate on that part of the map unit between 2 to 5 percent slopes which has been assigned to this capability class."

"cH2O", "3w7", "In normal years these soils have a seasonal high water table at a depth of between 18 and 40 inches for 1 to 4 months. In other months the water table is below these depths. Rarely, only during periods of high rainfall and only for a few days, is the water table above the normal seasonal high water table depth."

"dCUL", "3w7", "These soils have severe limitations for most cultivated crops due to wetness in wet seasons, droughtiness during periods of low rainfall, rapid leaching of plant nutrients and the hazard of erosion on slopes greater than 2 percent. These factors also limit the choice of plants and reduces potential yields of adapted crops. Maximum yields require proper seedbeds and nutrient management. Soil improving cover crops and all crop residues should be left on the ground. Erosion control measures are needed on that part of the map unit between 2 to 5 percent slopes which has been assigned to this capability class."

"eERO", "3w7", "Erosion control measures are needed on these soils on slopes above 2 percent. These include contour cultivation of row crops in alternate strips with cover crops. Crop rotations are needed that include cover crops at least two-thirds of the time. Soil improving cover crops and all crop residues should be left on the soil. Conservation tillage or no-till best protect the soil."

"fIRR", "3w7", "Irrigation of high value crops is usually feasible where irrigation water is readily available."

"hPAS", "3w7", "These soils are moderately suited to pastures. Hybrid bermudagrass and bahiagrasses are adapted. White clover and lespedezas are also adapted. These soils produce good yields where nutrient management is practiced. Controlled grazing is needed to maintain vigorous plants for maximum yields."

"iWMG", "3w7", "Tile, or other types of drains, are needed for some crops such as tobacco that are damaged by high water table during the growing season. Tiles can also be used as a source for subirrigation during periods of low rainfall."

4e1 Map Units CnD, FmD, FsD(Cowarts), OfD, RmD, RtD(Cowarts)

"aSOI", "4e1", "This map unit consists of strongly sloping, well drained soils on the side slopes of upland ridges. They have sandy or loamy surface layers less than 20 inches thick and moderately permeable loamy or clayey subsoil layers."

"bSAC", "4e1", "These soils have a well aerated root zone more than 72 inches thick. The available water capacity averages moderate to high in the root zone. They have moderate natural fertility and crops respond well to fertilization. Rainfall is readily absorbed and retained in the soils. Runoff from unprotected areas during rain is very rapid. The erosion hazard is very severe."

"cH2O", "4e1", "In normal years these soils do not have a seasonal high water table within 72 inches of the surface."

"dCUL", "4e1", "These soils are poorly suited to row crops because slopes are too steep and the hazard of erosion is too great to be safely cultivated. Crops such as corn, soybeans, and peanuts are only moderately suited. The slopes are too steep to be effectively terraced and erosion control measures are limited to the use of vegetative cover. All crops grown on these soils require nutrient management for best yields."

"eERO", "4e1", "Intensive erosion control measures are needed. Such measures include contour cultivation of row crops with alternating strips of close growing crops and crop rotations that include close growing vegetation on the land at least three-fourths of the time. All crop residues should be left on the land."

"fIRR", "4e1", "Crops produced on these soils are not normally irrigated"

"hPAS", "4e1", "These soils are moderately well suited to improved pastures. Hybrid bermudagrass and improved bahiagrasses are well adapted. Nutrient management and controlled grazing are needed for best yields and to assure a complete vegetative cover to prevent severe erosion."

"iWMG", "4e1", "Water table management is not normally practiced on crops produced on these soils."

4e2 Map Unit NfD

"aSOI", "4e2", "This map unit consists of strongly sloping, well drained soils on ridges and side slopes of uplands. They have sandy or loamy surface layers less than 20 inches thick, and moderately slowly permeable loamy subsoil layers."

"bSAC", "4e2", "A well aerated root zone is limited by compact subsoil layers at 30 to 50 inches below the surface. The soils average moderate to high available water capacity within the root zone. Natural fertility is low but crops respond moderately to fertilization. Runoff during rains is very rapid on unprotected areas and the hazard of erosion is very severe."

"cH2O", "4e2", "In normal years these soils do not have a seasonal high water table within 72 inches of the surface."

"dCUL", "4e2", "These soils are poorly suited to row crops because slopes are too steep and the hazard of erosion is too great to be safely cultivated. Crops such as corn, soybeans, and peanuts are only moderately suited. The slopes are too steep to be effectively terraced and erosion control measures are limited to the use of vegetative cover. All crops grown on these soils require nutrient management for best yields."

"eERO", "4e2", "Intensive erosion control measures are needed. Such measures include contour cultivation of row crops with alternating strips of close growing crops and crop rotations that include close growing vegetation on the land at least three-fourths of the time. All crop residues should be left on the land."

"fIRR", "4e2", "Crops produced on these soils are not normally irrigated"

"hPAS", "4e2", "These soils are moderately suited to improved pastures. Hybrid bermudagrass and improved bahiagrasses are only moderately adapted. Nutrient management and controlled grazing are needed for best yields and to assure a complete vegetative cover to prevent severe erosion."

"iWMG", "4e2", "Water table management is not normally practiced on crops produced on these soils."

4e3 Map Units AfD(Nankin), FsD(Nankin), LtD(Nankin), SsD(Shubuta)

"aSOI", "4e3", "This map unit consists of strongly sloping, well drained soils on side slopes of upland ridges. They have sandy or loamy surface layers less than 20 inches thick and slowly permeable subsoil layers."

"bSAC", "4e3", "These soils have a well aerated root zone 22 to 36 inches thick. It is limited by a slowly permeable firm subsoil. The available water capacity is low to moderate in the surface layers and moderate to high in the subsoil layers. These soils have low natural fertility and crop response to fertilization is only fair. Runoff from rain is very rapid on unprotected areas and the erosion hazard is very severe."

"cH2O", "4e3", "In normal years these soils have a seasonal high water table at a depth of between 36 and 48 inches for 1 to 4 months. In other months the water table is below these depths. Rarely, only during periods of high rainfall and only for a few days, is the water table above the normal seasonal high water table depth."

"dCUL", "4e3", "These soils are poorly suited to row crops because slopes are too steep and the hazard of erosion is too great to be safely cultivated. Crops such as corn, soybeans, and peanuts are only moderately suited. The slopes are too steep to be effectively terraced and erosion control measures are limited to the use of vegetative cover. All crops grown on these soils require nutrient management for best yields."

"eERO", "4e3", "Intensive erosion control measures are needed. Such measures include contour cultivation of row crops with alternating strips of close growing crops and crop rotations that include close growing vegetation on the land at least three-fourths of the time. All crop residues should be left on the land."

"fIRR", "4e3", "Crops produced on these soils are not normally irrigated"

"hPAS", "4e3", "These soils are moderately suited to improved pastures. Hybrid bermudagrass and improved bahiagrasses are moderately well adapted. Nutrient management and controlled grazing are needed for best yields and to assure a complete vegetative cover to prevent severe erosion."

"iWMG", "4e3", "Water table management is not normally practiced on crops produced on these soils."

4e4 Map Units FaC3(Cowarts), FmC2

"aSOI", "4e4", "This map unit consists of sloping, well drained soils on side slopes or low knolls and ridges of the upland. They have sandy or loamy surface layers less than 20 inches thick, and slowly or moderately slowly permeable subsoil layers."

"bSAC", "4e4", "These soils have a well aerated root zone restricted within 40 inches by loamy or clayey subsoils with slow permeability. The available water capacity is low to moderate in the root zone. The soils have low natural fertility and crop response to fertilization is poor. Runoff from rain is very rapid on unprotected areas and the erosion hazard is very severe."

"cH2O", "4e4", "In normal years these soils do not have a seasonal high water table within 72 inches of the surface."

"dCUL", "4e4", "These eroded soils are poorly suited to row crops because of slope and because or the hazard of additional erosion is too great to be safely cultivated. Crops such as corn, soybeans, and peanuts are only fairly suited. The slopes are too short or steep to be effectively terraced and erosion control measures are limited to the use of vegetative cover. All crops grown on these soils require nutrient management for best yields."

"eERO", "4e4", "Intensive erosion control measures are needed. Such measures include contour cultivation of row crops with alternating strips of close growing crops and crop rotations that include close growing vegetation on the land at least three-fourths of the time. All crop residues should be left on the land."

"fIRR", "4e4", "Crops produced on these soils are not normally irrigated."

"hPAS", "4e4", "These soils are fairly suited to improved pastures. Hybrid bermudagrass and improved bahiagrasses are moderately adapted. Nutrient management and controlled grazing are needed for best yields and to assure a complete vegetative cover to prevent severe erosion."

"iWMG", "4e4", "Water table management is not normally practiced on crops produced on these soils."

4e7 Map Units MfC3, MgC2, OfC2, RbC3, ReC2, RfC3, RmC2

"aSOI", "4e7", "This map unit consists of sloping, well drained soils on the side slopes of upland ridges. They have loamy surface layers less than 20 inches thick and moderately permeable loamy or clayey subsoil layers."

"bSAC", "4e7", "These eroded soils have a well aerated root zone more than 72 inches thick. The available water capacity averages moderate to high in the root zone. They have moderate natural fertility and crops respond well to fertilization. Rainfall is readily absorbed and retained in the soils. Runoff from unprotected areas during rain is very rapid. The erosion hazard is very severe."

"ch2O", "4e7", "In normal years these soils do not have a seasonal high water table within 72 inches of the surface."

"dCUL", "4e7", "These soils are poorly suited to row crops because slopes are too short or steep and the hazard of additional erosion is too great to be safely cultivated. Crops such as corn, soybeans, and peanuts are only moderately suited. The slopes are too steep to be effectively terraced and erosion control measures are limited to the use of vegetative cover. All crops grown on these soils require nutrient management for best yields."

"eERO", "4e7", "Intensive erosion control measures are needed. Such measures include contour cultivation of row crops with alternating strips of close growing crops and crop rotations that include close growing vegetation on the land at least three-fourths of the time. All crop residues should be left on the land."

"fIRR", "4e7", "Crops produced on these soils are not normally Irrigated."

"hPAS", "4e7", "These soils are moderately well suited to improved pastures. Hybrid bermudagrass and improved bahiagrasses are well adapted. Nutrient management and controlled grazing are needed for best yields and to assure a complete vegetative cover to prevent severe erosion."

"iWMG", "4e7", "Water table management is not normally practiced on crops produced on these soils."

4e8 Map Units CaC3, CnC2, SnC

"aSOI", "4e8", "This map unit consists of sloping, well drained soils on side slopes or low knolls and ridges of the upland. They have sandy or loamy surface layers less than 20 inches thick, and slowly permeable clayey subsoil layers."

"bSAC", "4e8", "These soils have a well aerated root zone restricted within 40 inches by loamy or clayey subsoils with slow permeability. The available water capacity is low to moderate in the root zone. The soils have low natural fertility and crop response to fertilizers is poor. Runoff from rain is very rapid on unprotected areas and the erosion hazard is very severe."

"cH2O", "4e8", "In normal years these soils do not have a seasonal high water table within 42 inches of the surface."

"dCUL", "4e8", "These soils are poorly suited to row crops because of slope and because of the hazard of additional erosion is too great to be safely cultivated. Crops such as corn, soybeans, and peanuts are only fairly suited. The slopes are too short or steep to be effectively terraced and erosion control measures are limited to the use of vegetative cover. All crops grown on these soils require nutrient management for best yields."

"eERO", "4e8", "Intensive erosion control measures are needed. Such measures include contour cultivation of row crops with alternating strips of close growing crops and crop rotations that include close growing vegetation on the land at least three-fourths of the time. All crop residues should be left on the land."

"fIRR", "4e8", "Crops produced on these soils are not normally irrigated."

"hPAS", "4e8", "These soils are fairly suited to improved pastures. Hybrid bermudagrass and improved bahiagrasses are moderately adapted. Nutrient management and controlled grazing are needed for best yields and to assure a complete vegetative cover to prevent severe erosion."

"iWMG", "4e8", "Water table management is not normally practiced on crops produced on these soils."

4e9 Map Units NfC2, TfC2

"aSOI", "4e9", "This map unit consists of sloping, well drained soils on side slopes or low knolls and ridges of the upland. They have sandy or loamy surface layers less than 20 inches thick, and moderately slowly permeable loamy subsoil layers."

"bSAC", "4e9", "These soils have a well aerated root zone restricted within 40 inches by loamy or clayey subsoils with slow permeability. The available water capacity is low to moderate in the root zone. The soils have low natural fertility and crop response to fertilization is poor. Runoff from rain is very rapid on unprotected areas and the erosion hazard is very severe."

"cH2O", "4e9", "In normal years these soils have a seasonal high water table at a depth of between 36 and 48 inches for 1 to 4 months. In other months the water table is below these depths. Rarely, only during periods of high rainfall and only for a few days, is the water table above the normal seasonal high water table depth."

"dCUL", "4e9", "These eroded soils are poorly suited to row crops because of slope and because of the hazard of additional erosion is too great to be safely cultivated. Crops such as corn, soybeans, and peanuts are only fairly suited. The slopes are too short or steep to be effectively terraced and erosion control measures are limited to the use of vegetative cover. All crops grown on these soils require nutrient management for best yields."

"eERO", "4e9", "Intensive erosion control measures are needed. Such measures include contour cultivation of row crops with alternating strips of close growing crops and crop rotations that include close growing vegetation on the land at least three-fourths of the time. All crop residues should be left on the land."

"fIRR", "4e9", "Crops produced on these soils are not normally irrigated."

"hPAS", "4e9", "These soils are fairly suited to improved pastures. Hybrid bermudagrass and improved bahiagrasses are moderately adapted. Nutrient management and controlled grazing are needed for best yields and to assure a complete vegetative cover to prevent severe erosion."

"iWMG", "4e9", "Water table management is not normally practiced on crops produced on these soils."

4s1 Map Units OtD, RsD

"aSOI", "4s1", "This map unit consists of strongly sloping, well drained soils on side slopes of the uplands. They have sandy surface and subsurface layers 20 to 40 inches thick, and moderately to moderately rapidly permeable loamy subsoil layers."

"bSAC", "4s1", "These soils have a well aerated root zone more than 72 inches thick. The available water capacity averages low to moderate in the root zone. Natural fertility is low and response to fertilization is moderate. Rainfall is rapidly absorbed on well vegetated areas. Runoff from unprotected areas is moderate and the hazard of erosion on these areas is severe."

"cH2O", "4s1", "In normal years these soils have no seasonal high water table within 72 inches."

"dCUL", "4s1", "These soils have very severe limitations for cultivated crops due to droughtiness and erosion. Droughtiness and rapid leaching of plant nutrients severely limit the choice of crops and the potential yields of adapted crops. The steepness of slopes further limits the suitability by making cultivation more difficult and increasing the hazard of erosion. Yields can be maximized with nutrient management."

"eERO", "4s1", "Intensive erosion control measures such as cultivating row crops the contour in alternate strips with cover crops are needed. Crop rotations should include cover crops at least two-thirds of the time. These cover crops and all residues of other crops should be returned to the soil."

"fIRR", "4s1", "Because of steep slopes, irrigation is not feasible on these soils."

"hPAS", "4s1", "These soils are moderately well suited to pastures. Deep rooting plants such as hybrid bermudagrass and bahiagrass are well adapted. They produce well when they are fertilized and limed. Controlled grazing is important to maintain vigorous plants for maximum yields and to provide good cover to minimize erosion."

"iWMG", "4s1", "Water table management is not normally practiced on these soils."

4s3 Map Units AdC, AfD(Blanton), BfC

"aSOI", "4s3", "This map unit consists of sloping to strongly sloping moderately well drained soils on side slopes of upland ridges. The soils have sandy surface and subsurface layers 40 to 80 inches thick and moderately permeable loamy subsoil layers."

"bSAC", "4s3", "The root zone of these soils is limited by droughtiness and somewhat by a seasonal high water table in wet seasons. Available water capacity averages very low to low in the root zone. Natural fertility is low and response to fertilization is moderate. Rainfall is rapidly absorbed and there is little runoff. The hazard of erosion is moderate."

"cH2O", "4s3", "In normal years these soils have a seasonal high water table at a depth of between 40 and 60 inches for 1 to 4 months. In other months the water table is below these depths. Rarely, only during periods of high rainfall and only for a few days, is the water table above the normal seasonal high water table depth."

"dCUL", "4s3", "These soils have severe limitations for cultivated crops. Droughtiness and rapid leaching of plant nutrients reduce the number of well adapted crops and the potential yields of plants that are adapted. The control of erosion is also a management concern. Nutrient management maximizes yields."

"eERO", "4s3", "Moderate erosion control measures are needed such as cultivating row crops on the contour in strips alternating with close growing, soil building crops. Crop rotations should include close growing, soil improving crops on the land at least three-fourths of the time. Soil building cover crops and all crop residues should be left on the land."

"fIRR", "4s3", "Irrigation of some high value crops is usually feasible where irrigation water is readily available. The rate of water application should be low enough to prevent runoff and erosion."

"hPAS", "4s3", "These soils are moderately suited to pastures and hay crops. The soils are droughty and have low nutrient holding capacity and most grasses make only moderate growth when carefully managed. Deep rooting hybrid bermudagrass and bahiagrasses are best adapted. They require nutrient management and carefully controlled grazing to maintain vigorous plants."

"iWMG", "4s3", "Water table management is not normally practiced on these soils."

4s7 Map Unit EdB

"aSOI", "4s7", "This map unit consists of nearly level and gently sloping, well drained to excessively drained soils on to broad ridges. These soils have very rapidly permeable sandy layers to depths of more than 80 inches."

"bSAC", "4s7", "The root zone of these soils well aerated to a depth of 80 inches or more. Root development is limited by droughtiness. The available water capacity is low to very low in the root zone. Natural fertility is low and crop response to fertilization is low to moderate. Rainfall is rapidly absorbed and there is little runoff. The hazard of erosion is slight. "

"cH2O", "4s7", "In normal years these soils do not have a seasonal high water table within a depth of 80 inches."

"dCUL", "4s7", "These soils have very severe limitations for most cultivated crops due to droughtiness and the rapid leaching of plant nutrients. These factors also limit the choice of plants and reduces potential yields of adapted crops. Crop rotations should include close growing crops on the land at least two-thirds of the time. Irrigation and nutrient management are requirements for acceptable yields. Soil improving cover crops and all crop residues should be left on the ground."

"fIRR", "4s7", "Although irrigation is a requirement for acceptable yields, due to the low water holding capacity of these soils, irrigation of all crops except a high value crops is not usually feasible. Locating a reliable and economical source of irrigation water is another management concern."

"hPAS", "4s7", "These soils are moderately suited to pastures. Deep-rooting plants such as Hybrid bermudagrass and bahiagrasses are adapted but yields are restricted due to droughtiness. Nutrient management is a required practice. Controlled grazing is needed to maintain vigorous plants for maximum yields."

"iWMG", "4s7", "Water table management is not normally practiced on these soils."

4s8 Map Unit NsD

"aSOI", "4s8", "This map unit consists of strongly sloping, well drained soils on side slopes of the uplands. They have sandy surface and subsurface layers 20 to 40 inches thick, and moderately to moderately rapidly permeable loamy subsoil layers."

"bSAC", "4s8", "These soils have a well aerated root zone more than 72 inches thick. The available water capacity averages low to moderate in the root zone. Natural fertility is low and response to fertilization is moderate. Rainfall is rapidly absorbed on well vegetated areas. Runoff from unprotected areas is moderate and the hazard of erosion on these areas is severe."

"cH2O", "4s8", "In normal years these soils have a seasonal high water table at a depth of between 42 and 72 inches for 1 to 4 months. In other months the water table is below these depths. Rarely, only during periods of high rainfall and only for a few days, is the water table above the normal seasonal high water table depth."

"dCUL", "4s8", "These soils have severe limitations for cultivated crops due to droughtiness and erosion. Droughtiness and rapid leaching of plant nutrients limit the choice of crops and the potential yields of adapted crops. The steepness of slopes further limits the suitability by making cultivation more difficult and increasing the hazard of erosion. Yields can be maximized with nutrient management."

"eERO", "4s8", "Intensive erosion control measures such as cultivating row crops the contour in alternate strips with cover crops are needed. Crop rotations should include cover crops at least three-fourths of the time. These cover crops and all residues of other crops should be returned to the soil."

"fIRR", "4s8", "Because of steep slopes, irrigation is not feasible on these soils."

"hPAS", "4s8", "These soils are moderately well suited to pastures. Deep rooting plants such as hybrid bermudagrass and bahiagrass are well adapted. They produce well when they are fertilized and limed. Controlled grazing is important to maintain vigorous plants for maximum yields and to provide good cover to minimize erosion."

"iWMG", "4s8", "Water table management is not normally practiced on these soils."

4s20 Map Units EmC, LtC(Troup), RtC(Troup)

"aSOI", "4s20", "This map unit consists of sloping, well drained soils on upland ridges. They have sandy surface and subsurface layers that are 40 to 80 inches thick, and moderately permeable loamy subsoil layers."

"bSAC", "4s20", "These soils have a well aerated root zone that is not limited above a depth of about 72 inches. The available water capacity averages low to moderate in the root zone. Natural fertility is low and response to fertilization is moderate. Rainfall is rapidly absorbed on well vegetated areas. Runoff from unprotected areas is slight and the hazard of erosion on these areas is moderate."

"cH2O", "4s20", "In normal years these soils do not have a seasonal high water table within a depth of 72 inches."

"dCUL", "4s20", "These soils have severe limitations for cultivated crops due to droughtiness. Droughtiness and the rapid leaching of plant nutrients limit the choice of crops and the potential yields of adapted crops. Erosion is an additional hazard. Yields can be maximized with nutrient management."

"eERO", "4s20", "Moderate erosion control measures such as cultivating row crops the contour in alternate strips with cover crops are needed. Crop rotations should include cover crops at least two-thirds of the time. These cover crops and all residues of other crops should be returned to the soil."

"fIRR", "4s20", "Irrigation of some high value crops is usually feasible where irrigation water is readily available."

"hPAS", "4s20", "These soils are moderately suited to pastures. Hybrid bermudagrass and bahiagrasses are well adapted but yields are reduced during periodic droughts. They produce well when they are fertilized and limed. Controlled grazing is needed to maintain vigorous plants for maximum yields, minimize the effects of droughts and to maintain good ground cover to minimize erosion."

"iWMG", "4s20", "Water table management is not normally practiced on these soils."

4s21 Map Units KsC, LaD, LdD, LnD

"aSOI", "4s21", "This map unit consists of sloping, well drained soils on upland ridges. They have sandy surface and subsurface layers that are 40 to 80 inches thick, and moderately permeable loamy subsoil layers."

"bSAC", "4s21", "These soils have a well aerated root zone that is limited by a seasonal high water table in wet season and droughtiness during periods of low rainfall. The available water capacity averages low to moderate in the root zone. Natural fertility is low and response to fertilization is moderate. Rainfall is rapidly absorbed on well vegetated areas. Runoff from unprotected areas is slight and the hazard of erosion on these areas is moderate."

"cH2O", "4s21", "In normal years these soils have a seasonal high water table at a depth of between 48 and 72 inches for 1 to 4 months. In other months the water table is below these depths. Rarely, only during periods of high rainfall and only for a few days, is the water table above the normal seasonal high water table depth."

"dCUL", "4s21", "These soils have severe limitations for cultivated crops due to droughtiness. Droughtiness and the rapid leaching of plant nutrients limit the choice of crops and the potential yields of adapted crops. The hazard of erosion is an additional management concern. Yields can be maximized with nutrient management."

"eERO", "4s21", "Moderate erosion control measures such as cultivating row crops on the contour in alternate strips with cover crops are needed. Crop rotations should include cover crops at least two-thirds of the time. These cover crops and all residues of other crops should be returned to the soil"

"fIRR", "4s21", "Irrigation of some high value crops is usually feasible where irrigation water is readily available."

"hPAS", "4s21", "These soils are moderately suited to pastures. Hybrid bermudagrass and bahiagrasses are well adapted but yields are reduced during periodic droughts. They produce well when they are fertilized and limed. Controlled grazing is needed to maintain vigorous plants for maximum yields, minimize the effects of droughts and to maintain good ground cover to minimize erosion."

"iWMG", "4s21", "Water table management is not normally practiced on these soils."

4w4 Non-Hydric phases of Map Units Lv, Pt, Ra

"aSOI", "4w4", "This map unit consists of nearly level, poorly drained soils on flatwoods, hammocks, and other flat areas. They have sandy surface and subsurface layers less than 20 inches thick over moderately to slowly permeable loamy and clayey layers."

"bSAC", "4w4", "The root zone is limited by a seasonal high water table that comes to near the surface in wet seasons. The available water capacity averages moderate in the root zone. Natural fertility is low but crop response to fertilization is good. Internal drainage is slow but response to artificial drainage is moderate to rapid. The hazard of erosion is slight."

"cH2O", "4w4", "In normal years these soils have a seasonal high water table at a depth of between 6 and 18 inches for 1 to 4 months. In other months the water table is below these depths. Rarely, only during periods of high rainfall and only for a few days, is the water table above the normal seasonal high water table depth."

"dCUL", "4w4", "These soils have severe limitations for cultivated crops because of wetness."

"eERO", "4w4", "Crops produced on these soils do not normally need special erosion control practices."

"fIRR", "4w4", "Crops produced on these soils are not normally irrigated."

"hPAS", "4w4", "These soils are moderately well suited to pastures and hay crops. Improved grasses such as improved bahiagrasses are well adapted. Several varieties of clovers are also well adapted where properly managed. High yields require nutrient management, water table management, and controlled grazing to prevent overgrazing."

"iWMG", "4w4", "A total water table management system should remove excess water rapidly and provide a means of applying subirrigation. Tile drains, open ditches, and/or tail-race recovery systems may be needed to maintain the preferred water table depths. To obtain adequate drainage, the spacing of tile drains is important. Tile drains may be used for subirrigation during periods of low rainfall."

4w5 Non-Hydric phase of Map Unit Lw

"aSOI", "4w5", "This map unit consists of nearly level, poorly drained soils on flatwoods, hammocks, and other flat areas. They have sandy layers more than 72 inches thick and a spodic horizon within 30 inches of the surface."

"bSAC", "4w5", "The root zone is limited by a seasonal high water table that comes to near the surface in wet seasons. The available water capacity averages moderate in the root zone. Natural fertility is low but crop response to fertilization is good. Internal drainage is slow but response to artificial drainage is moderate to rapid. The hazard of erosion is slight."

"cH2O", "4w5", "In normal years these soils have a seasonal high water table at a depth of between 6 and 18 inches for 1 to 4 months. In other months the water table is below these depths. Rarely, only during periods of high rainfall and only for a few days, is the water table above the normal seasonal high water table depth."

"dCUL", "4w5", "These soils have severe limitations for cultivated crops because of wetness. With a total water management system these soils are suited to such crops as corn and soybeans. Management should include crop rotations that keep the soil in close growing cover crops at least two-thirds of the time. The cover crops and all other crop residue should be returned to the soil. Maximum yields require good soil tilth and nutrient management."

"eERO", "4w5", "Crops produced on these soils do not normally need special erosion control practices."

"fIRR", "4w5", "Crops produced on these soils are not normally irrigated."

"hPAS", "4w5", "These soils are well suited to pastures and hay crops. Improved grasses such as improved bahiagrasses are well adapted. Several varieties of clovers are also well adapted where properly managed. High yields require nutrient management, water table management, and controlled grazing to prevent overgrazing."

"iWMG", "4w5", "A total water table management system should remove excess water rapidly and provide a means of applying subirrigation. Tile drains, open ditches, and/or tail-race recovery systems may be needed to maintain the preferred water table depths. To obtain adequate drainage, the spacing of tile drains is important. Tile drains may be used for subirrigation during periods of low rainfall."

4w7 Non-Hydric phase of Map Unit PsA, PsB

"aSOI", "4w7", "This map unit consists of nearly level, poorly drained soils on flatwoods, hammocks, and other flat areas. They have sandy surface and subsurface layers 20 to 60 inches thick over moderately to moderately rapidly permeable loamy layers."

"bSAC", "4w7", "The root zone is limited by a seasonal high water table that comes to near the surface in wet seasons. The available water capacity averages moderate in the root zone. Natural fertility is low but crop response to fertilization is good. Internal drainage is slow but response to artificial drainage is moderate to rapid. The hazard of erosion is slight."

"cH2O", "4w7", "In normal years these soils have a seasonal high water table at a depth of between 6 and 18 inches for 1 to 4 months. In other months the water table is below these depths. Rarely, only during periods of high rainfall and only for a few days, is the water table above the normal seasonal high water table depth."

"dCUL", "4w7", "These soils have severe limitations for cultivated crops because of wetness. With a total water management system these soils are suited to such crops as corn and soybeans. Management should include crop rotations that keep the soil in close growing cover crops at least two-thirds of the time. The cover crops and all other crop residue should be returned to the soil. Maximum yields require good soil tilth and nutrient management."

"eERO", "4w7", "Crops produced on these soils do not normally need special erosion control practices."

"fIRR", "4w7", "Crops produced on these soils are not normally irrigated."

"hPAS", "4w7", "These soils are well suited to pastures and hay crops. Improved grasses such as improved bahiagrasses are well adapted. Several varieties of clovers are also well adapted where properly managed. High yields require nutrient management, water table management, and controlled grazing to prevent overgrazing."

"iWMG", "4w7", "A total water table management system should remove excess water rapidly and provide a means of applying subirrigation. Tile drains, open ditches, and/or tail-race recovery systems may be needed to maintain the preferred water table depths. To obtain adequate drainage, the spacing of tile drains is important. Tile drains may be used for subirrigation during periods of low rainfall."

4w23 Hydric phases of Map Units Lv, Ra

"aSOI", "4w23", "This map unit consists of nearly level, poorly drained soils on low flatwoods, low hammocks, and sloughs. They have sandy surface and subsurface layers less than 20 inches thick over moderately to slowly permeable loamy and clayey layers."

"bSAC", "4w23", "The root zone is limited by a seasonal high water table that is at or slightly above the surface in wet seasons. The available water capacity averages moderate in the root zone. Natural fertility is low but crop response to fertilization is good. Internal drainage is slow but response to artificial drainage is moderate to rapid. The hazard of erosion is slight."

"cH2O", "4w23", "In normal years these soils have a seasonal high water table at a depth of 6 inches or less for 2 to 6 months. In other months the water table is usually below this depths. During periods of high rainfall the water table may be above the surface for periods of brief duration."

"dCUL", "4w23", "Cultivation of these hydric soils is not recommended. If cultivated, these soils have severe limitations because of wetness. "

"eERO", "4w23" These hydric soils do not normally need special erosion control practices."

"fIRR", "4w23", "If cultivated, highest yields require irrigation during periods of low rainfall either subirrigated through a water table management system or by sprinklers."

"hPAS", "4w23", "These hydric soils are not suited to pasture or hay crops without an extensive water table management system."

"iWMG", "4w23", "If cropped, these hydric soils need a total water table management system to remove excess water rapidly and provide a means of applying subirrigation. Tile drains, open ditches, and/or tail-race recovery systems may be needed to maintain the preferred water table depths. To obtain adequate drainage, the spacing of tile drains is important. Tile drains may be used for subirrigation during periods of low rainfall. "

4w24 Hydric phase of Map Unit Lw

"aSOI", "4w24", "This map unit consists of nearly level, poorly drained soils on flatwoods, hammocks, and other flat areas. They have sandy layers more than 72 inches thick and a spodic horizon within 30 inches of the surface."

"bSAC", "4w24", "The root zone is limited by a seasonal high water table that is at or slightly above the surface in wet seasons. The available water capacity averages moderate in the root zone. Natural fertility is low but crop response to fertilizer is good. Internal drainage is slow but response to artificial drainage is moderate to rapid. The hazard of erosion is slight."

"cH2O", "4w24", "In normal years these soils have a seasonal high water table at a depth of 6 inches or less for 2 to 6 months. In other months the water table is usually below this depth. During periods of high rainfall the water table may be above the surface for periods of brief duration."

"dCUL", "4w24", "Cultivation of these hydric soils is not recommended. If cultivated, these soils have severe limitations because of wetness. With a total water management system these soils are suited to a variety of fruit and vegetable crops. Management should include crop rotations that keep the soil in close growing cover crops at least two-thirds of the time. The cover crops and all other crop residue should be returned to the soil. Maximum yields require good soil tilth and nutrient management."

"eERO", "4w24", "Crops produced on these hydric soils do not normally need special erosion control practices."

"fIRR", "4w24", "If cultivated, Highest yields require irrigation during periods of low rainfall either subirrigated through a water table management system or by sprinklers."

"hPAS", "4w24", "These hydric soils are well suited to pastures and hay crops. Improved grasses such as the improved bahiagrasses are well adapted. Several varieties of clovers are also well adapted where properly managed. High yields require nutrient management, water table management, and controlled grazing to prevent overgrazing."

"iWMG", "4w24", "If cropped, these hydric soils need a total water table management system to remove excess water rapidly and provide a means of applying subirrigation. Tile drains, open ditches, and/or tail-race recovery systems may be needed to maintain the preferred water table depths of within 18 inches for vegetables and below four feet for citrus. To obtain adequate drainage, the spacing of tile drains is important. Tile drains may be used for subirrigation during periods of low rainfall. "

4w26 Hydric phase of Map Unit PsA

"aSOI", "4w26", "This map unit consists of nearly level, poorly drained soils on low flatwoods, low hammocks, and sloughs. They have sandy surface and subsurface layers 40 to 80 inches thick over moderately to moderately rapidly permeable loamy layers."

"bSAC", "4w26", "The root zone is limited by a seasonal high water table that is at or slightly above the surface in wet seasons. The available water capacity averages moderate in the root zone. Natural fertility is low but crop response to fertilization is good. Internal drainage is slow but response to artificial drainage is moderate to rapid. The hazard of erosion is slight."

"cH2O", "4w26", "In normal years these soils have a seasonal high water table at a depth of 6 inches or less for 2 to 6 months. In other months the water table is usually below this depths. During periods of high rainfall the water table may be above the surface for periods of brief duration."

"dCUL", "4w26", "Cultivation of these hydric soils is not recommended. If cultivated, these soils have severe limitations because of wetness. "

"eERO", "4w26", "Crops produced on these hydric soils do not normally need special erosion control practices."

"fIRR", "4w26", "If cultivated, highest yields require irrigation during periods of low rainfall either through subirrigation through a water table management system or by sprinklers."

"hPAS", "4w26", "These hydric soils are not suited to pasture or hay crops without an extensive water table management system."

"iWMG", "4w26", "If cropped, these hydric soils need a total water table management system to remove excess water rapidly and provide a means of applying subirrigation. Tile drains, open ditches, and/or tail-race recovery systems will be needed to maintain the preferred water table depths. To obtain adequate drainage, the spacing of tile drains is important. Tile drains may be used for subirrigation during periods of low rainfall. "

4w30 Hydric phase of Map Unit Co

"aSOI", "4w30", "This map unit consists of nearly level, somewhat poorly drained soils on floodplains of river swamps. They have moderately slowly to slowly permeable subsoils within 10 inches of the surface."

"bSAC", "4w30", "The root zone is limited by a seasonal high water table and by flooding. The available water capacity is high to very high. Natural fertility is moderate and crops respond well to fertilization. The internal drainage rate is slow under natural conditions, but response to drainage is rapid."

"cH2O", "4w30", "In normal years these hydric soils have a seasonal high water table at a depth of 18 to 24 inches for 1 to 4 months. In other months the water table is usually below these depths. Rarely is the water table above 18 inches. These soils are flooded frequently for long duration. Most often flooding occurs in the spring, but it may occur during any wet season."

"dCUL", "4w30", "These soils have severe limitations to cultivated crops because of flooding. In their natural conditions these soils are not suited to cultivated crops; however, with a total water table management system they are well suited to most crops grown in the area. Nutrient management maximizes yields. All crop residue should be returned to the soil. The erosion hazard is slight."

"eERO", "4w30", "Crops produced on these soils do not normally need special erosion control practices."

"fIRR", "4w30", "Crops produced on these soils are not normally irrigated."

"hPAS", "4w30", "These soils have severe limitations to pasture crops because of flooding. In their natural conditions, these soils are not suited to pasture grasses; however, with a total water table management system they are well suited to most grasses grown in the area. Nutrient management maximizes yields."

"iWMG", "4w30", "A total water table management system is needed for crop and pasture production on these soils. It should remove excess water rapidly and provide a means of applying subirrigation. Dikes and a pumping systems are needed for flood control and tile drains and open ditches are needed to maintain the preferred water table depth. Rarely are drainage and flood protection economically feasible and environmentally sound."

5w4 Hydric phase of Map Unit Gr

"aSOI", "5w4", "This map unit consists of nearly level, poorly drained and very poorly drained soils in depressions. They have sandy or loamy upper layers less than 20 inches thick, and slowly permeable clayey subsoil layers. They are covered with shallow water much of the time."

"bSAC", "5w4", "Wetness and ponding severely limits the use of the root zone of these soils for agronomic crops. "

"cH2O", "5w4", "In normal years these hydric soils have a seasonal high water table within 6 inches of the surface for 2 to 6 months or more. In other months the water table is usually below these depths. These soils are also ponded frequently for long duration. Most often ponding occurs in the winter and spring, but it may occur during any wet season."

"dCUL", "5w4", "These hydric soils are not suited to cultivated crops without an extensive water table management system."

"eERO", "5w4", "Erosion is not a management concern for crops produced on these hydric soils."

"fIRR", "5w4", "If cultivated, highest yields require irrigation either subirrigated through the extensive water table management system or by sprinklers."

"hPAS", "5w4", "These hydric soils are not suited to pasture or hay crops without an extensive water table management system."

"iWMG", "5w4", "If these hydric soils are cultivated, an extensive water table management system is needed for crop and pasture production on these soils. It should remove excess water rapidly and provide a means of applying subirrigation. Dikes and a pumping systems are needed for ponding control and tile drains and open ditches are needed to maintain the preferred water table depth. Rarely are drainage and ponding protection economically feasible and environmentally sound."

5w6 Hydric phase of Map Units Ab(Bibb), MyB, Sw

"aSOI", "5w6", "This map unit consists of nearly level, very poorly drained and poorly drained soils on flood plains. They are saturated or flooded with water much of the time."

"bSAC", "5w6", "Wetness and flooding severely limits the use of the root zone of these soils for agronomic crops. "

"cH2O", "5w6", "In normal years these hydric soils have a seasonal high water table within 6 inches of the surface for 2 to 6 months or more. In other months the water table is usually below these depths. These soils are also flooded commonly for long duration. Most often flooding occurs in the winter and spring, but it may occur during any wet season."

"dCUL", "5w6", "These hydric soils are not suited to cultivated crops without an extensive water table management system."

"eERO", "5w6", "Erosion is not a management concern on crops produced on these hydric soils."

"fIRR", "5w6", "If cultivated, highest yields require irrigation either subirrigated through the extensive water table management system or by sprinklers."

"hPAS", "5w6", "These hydric soils are not suited to pasture or hay crops without an extensive water table management system."

"iWMG", "5w6", "If these hydric soils are cultivated, an extensive water table management system is needed for crop and pasture production on these soils. It should remove excess water rapidly and provide a means of applying subirrigation. Dikes and a pumping systems are needed for flood control and tile drains and open ditches are needed to maintain the preferred water table depth. Rarely are drainage and flood protection economically feasible and environmentally sound."

5w24 Hydric Map Unit PsB

"aSOI", "5w24", "This map unit consists of gently sloping to sloping, poorly drained soils on side slope seep positions in the uplands and along ridges. They are saturated with water much of the time. Excess seepage results in shallow sheet flow of water after heavy rains."

"bSAC", "5w24", "Wetness severely limits the use of the root zone of these soils for agronomic crops. "

"cH2O", "5w24", "In normal years these hydric soils have a seasonal high water table within 6 inches of the surface for 2 to 6 months or more. In other months the water table is usually within 12 inches of the surface. These soils are also commonly covered with sheet flow of water for long duration. Total saturation occurs during any wet season."

"dCUL", "5w24", "These hydric soils are not suited to cultivation of crops."

"eERO", "5w24", "Erosion is a major management concern on disturbed areas of these hydric soils."

"fIRR", "5w24", "Due to the lack of cultivation, irrigation is not a normal practice on these soils."

"hPAS", "5w24", "These hydric soils are not suited to pasture or hay crops."

"iWMG", "5w24", "Cultivation of these hydric soils is not practical because an extensive water table management system is needed for crop and pasture production. It should remove excess water rapidly and provide a means of applying subirrigation. Diversion terraces are needed to address upslope water, a pumping system is needed for irrigation and tile drains are needed to maintain the preferred water table depth. Rarely are drainage and upslope water protection economically feasible and environmentally sound."

6e3 Map Units CsD, FsD3(Nankin)

"aSOI", "6e3", "This map unit consists of strongly sloping, well drained soils on upland knolls and side slopes of short ridges. These soils have a past history of erosion. They have sandy or loamy surface layers less than 10 inches thick, and slowly permeable clayey subsoil layers."

"bSAC", "6e3", "The soils have a well aerated root zone 20 to 60 inches thick that is restricted by a firm, slowly permeable subsoil, marl or limestone. Available water capacity averages low to moderate in the root zone. Natural fertility is moderate. The soils absorb water rapidly where protected by a vegetative cover, but runoff from unprotected areas is very rapid. The hazard of erosion is very severe."

"cH2O", "6e3", "In normal years these soils do not have a seasonal high water table within 72 inches of the surface."

"dCUL", "6e3", "These soils are not suited to cultivated crops. Slopes are too steep and too easily eroded. These soils should be maintained in permanent vegetative covers."

"eERO", "6e3", "If these soils are cultivated, erosion control measures that would adequately protect the soil and water resource base are difficult to install and/or maintain."

"fIRR", "6e3", "Due to the lack of cultivation, irrigation is not a normal practice on these soils."

"hPAS", "6e3", "These soils are poorly suited to pastures and hay crops. Adapted grasses such as hybrid bermudagrass and bahiagrass grow moderately well under careful management but harvestable yields are low because of the need to maintain a dense cover by use of a very restricted grazing program."

"iWMG", "6e3", "Water table management is not a normal practice on these soils because of the lack of cultivation."

6e4 Map Units BaC, SrD(Sumter)

"aSOI", "6e4", "This map unit consists of sloping and strongly sloping somewhat poorly to moderately well drained soils on short side slopes of the uplands. They have sandy or loamy surface layers less than 20 inches thick, very slow permeable clayey subsoil layers, and limestone bedrock within 60 inches. "

"bSAC", "6e4", "These soils have a root zone that is severely restricted by firm, very plastic subsoil. Water is perched within the surface layers for short periods during rainy seasons. A very limited number of crops are suited. The available water capacity of the surface layers is moderate to low. The surface layers become saturated during prolonged rains and surface runoff is rapid. This causes a very severe erosion hazard for unprotected areas."

"cH2O", "6e4", "In normal years these soils do not have a seasonal high water table within 72 inches of the surface."

"dCUL", "6e4", "These soils are not suited to cultivated crops. Slopes are too steep and too easily eroded. These soils should be maintained in permanent vegetative covers."

"eERO", "6e4", "If these soils are cultivated, erosion control measures that would adequately protect the soil and water resource base are difficult to install and/or maintain."

"fIRR", "6e4", "Due to the lack of cultivation, irrigation is not a normal practice on these soils."

"hPAS", "6e4", "These soils are poorly suited to pastures and hay crops. Adapted grasses such as hybrid bermudagrass and bahiagrass grow moderately well under careful management but harvestable yields are low because of the need to maintain a dense cover by use of a very restricted grazing program."

"iWMG", "6e4", "Water table management is not a normal practice on these soils because of the lack of cultivation and an available water source."

6e5 Map Units FaD3, FsD3(Cowarts), MfD3, MgD, ReD, SrD(Oktibbeha), SsD(Oktibbeha)

"aSOI", "6e5", "This map unit consists of strongly sloping, well and moderately well drained soils on the side slopes of low ridges of the uplands. They have sandy or loamy surface layers less than 20 inches thick, and moderately slowly to slowly permeable clayey or loamy subsoil layers."

"bSAC", "6e5", "A well aerated root zone is limited by the compact subsoil layers at 30 to 60 inches below the surface. The available water capacity averages moderate to high in the root zone. Natural fertility is low and crops respond only moderately to nutrient management. Runoff during rains is very rapid on unprotected areas and the hazard of erosion is very severe."

"cH2O", "6e5", "In normal years these soils do not have a seasonal high water table within 72 inches of the surface."

"dCUL", "6e5", "These soils are not suited to cultivated crops. Slopes are too steep and too easily eroded. These soils should be maintained in permanent vegetative covers."

"hPAS", "6e5", "These soils are poorly suited to pastures and hay crops. Adapted grasses such as hybrid bermudagrass and bahiagrass grow moderately well under careful management but harvestable yields are low because of the need to maintain a dense cover by use of a very restricted grazing program."

"eERO", "6e5", "If these soils are cultivated, erosion control measures that would adequately protect the soil and water resource base are difficult to install and/or maintain."

"fIRR", "6e5", "Due to the lack of cultivation, irrigation is not a normal practice on these soils."

"iWMG", "6e5", "Water table management is not a normal practice on these soils because of the lack of cultivation and an available water source."

6e6 Map Units RbD3

"aSOI", "6e6", "This map unit consists of strongly sloping, well drained soils on upland knolls and side slopes of short ridges. These soils have a past history of erosion. They have sandy or loamy surface layers less than 10 inches thick, and moderately slowly permeable subsoil layers."

"bSAC", "6e6", "The soils have a well aerated root zone more than 60 inches. Available water capacity averages moderate to high in the root zone. Natural fertility is moderate. The soils absorb water rapidly where protected by a vegetative cover, but runoff from unprotected areas is very rapid. The hazard of erosion is very severe."

"cH2O", "6e6", "In normal years these soils do not have a seasonal high water table within 72 inches of the surface."

"dCUL", "6e6", "These eroded soils are not suited to cultivated crops. Slopes are too steep and too easily eroded. These soils should be maintained in permanent vegetative covers."

"eERO", "6e6", "If these soils are cultivated, erosion control measures that would adequately protect the soil and water resource base are difficult to install and/or maintain."

"fIRR", "6e6", "Due to the lack of cultivation, irrigation is not a normal practice on these soils."

"hPAS", "6e6", "These soils are poorly suited to pastures and hay crops. Adapted grasses such as hybrid bermudagrass and bahiagrass grow moderately well under careful management but harvestable yields are low because of the need to maintain a dense cover by use of a very restricted grazing program."

"iWMG", "6e6", "Water table management is not a normal practice on these soils because of the lack of cultivation and an available water source."

6s1 Map Units LdD, LnD

"aSOI", "6s1", "This map unit consists of strongly sloping, moderately well drained soils on side slopes of low ridges of the uplands. They have sandy surface and subsurface layers 40 to 80 inches thick and moderately permeable and moderately slowly permeable, loamy subsoil layers."

"bSAC", "6s1", "These soils have root zones thicker than 80 inches. The available water capacity averages low to very low in the root zone. Natural fertility is low and crop response to fertilization is only moderate. Rainfall is absorbed on protected areas and there is little runoff. The hazard of gully erosion is severe on unprotected areas."

"cH2O", "6s1", "In normal years these soils have a seasonal high water table at a depth of between 40 and 60 inches for 1 to 4 months. In other months the water table is below these depths. Rarely, only during periods of high rainfall and only for a few days, is the water table above the normal seasonal high water table depth."

"dCUL", "6s1", "Due to steepness of slope, droughtiness, and the hazard of erosion, these soils are not suited to cultivated crops."

"eERO", "6s1", "If these soils are cultivated, erosion control measures that would adequately protect the soil and water resource base are difficult to install and/or maintain."

"fIRR", "6s1", "Irrigation of high value crops is usually feasible where irrigation water is readily available. The rate of water application should be low enough to prevent runoff and erosion."

"hPAS", "6s1", "These soils are poorly suited to improved pastures. Deep rooting plants such as hybrid bermudagrass and improved bahiagrass are well adapted. They grow well and produce good ground cover where nutrient management is practiced, but grazing must be greatly restricted to maintain vigorous plants for adequate growth to maintain complete ground cover for soil protection. Nutrient management is required to maintain vigorous plants for acceptable yields."

"iWMG", "6s1", "Water table management is not normally practiced on these soils."

6s2 Map Unit LcD

"aSOI", "6s2", "This map unit consists of sloping to strongly sloping excessively drained soils on side slopes of the uplands. They have rapidly permeable sandy layers to depths of more than 80 inches."

"bSAC", "6s2", "These soils have a well aerated root zone more than 80 inches thick. Available water capacity averages very low in the root zone. Natural fertility is low and response to fertilization is low. Rainfall is absorbed on protected areas and there is little runoff. The hazard of sheet erosion is moderate on unprotected areas and the hazard of gully erosion is severe where runoff water is concentrated."

"ch2O", "6s2", "In normal years these soils do not have a seasonal high water table within a depth of 72 inches."

"dCUL", "6s2", "These soils are not suitable for cultivated crops because of droughtiness, steepness of slope, and susceptibility to gully erosion."

"eERO", "6s2", "If these soils are cultivated, erosion control measures that would adequately protect the soil and water resource base are difficult to install and/or maintain."

"fIRR", "6s2", "Due to the lack of cultivation, irrigation is not a normal practice on these soils."

"hPAS", "6s2", "These soils are moderately suited for pastures. Deep rooting plants such as hybrid bermudagrass and bahiagrass are well adapted but yields are reduced by periodic droughts. Nutrient management is needed. Grazing should be controlled to permit plants to maintain vigor for highest yields."

"iWMG", "6s2", "Water table management is not normally practiced on these soils."

6s21 Map Units EcD, LtD(Troup), RtD(Troup)

"aSOI", "6s21", "This map unit consists of strongly sloping, well drained soils on side slopes of low ridges of the uplands. They have sandy surface and subsurface layers 40 to 80 inches thick and moderately permeable, loamy subsoil layers."

"bSAC", "6s21", "These soils have root zones thicker than 80 inches. The available water capacity averages low to very low in the root zone. Natural fertility is low and crop response to fertilizers is only moderate. Rainfall is absorbed on protected areas and there is little runoff. The hazard of gully erosion is severe on unprotected areas."

"cH2O", "6s21", "In normal years these soils do not have a seasonal high water table within a depth of 72 inches."

"dCUL", "6s21", "Due to steepness of slope, droughtiness, and the hazard of erosion, these soils are not suited to cultivated crops."

"eERO", "6s21", "If these soils are cultivated, erosion control measures that would adequately protect the soil and water resource base are difficult to install and/or maintain."

"fIRR", "6s21", "Irrigation of high value crops is usually feasible where irrigation water is readily available. The rate of water application should be low enough to prevent runoff and erosion."

"hPAS", "6s21", "These soils are moderately suited for pastures. Deep rooting plants such as hybrid bermudagrass and bahiagrass are well adapted but yields are reduced by periodic droughts. Nutrient management is needed. Grazing should be controlled to permit plants to maintain vigor for highest yields."

"iWMG", "6s21", "Water table management is not normally practiced on these soils."

6w3 Hydric phases of Map Units Pt, RuA

"aSOI", "6w3", "This capability unit consists of nearly level, very poorly drained soils that occur in depressions. These soils are mineral soils. "

"bSAC", "6w3", "The root zone is restricted by a water table that is at or above the surface during wet seasons. The internal drainage is slow and response to artificial drainage is poor. The available water capacity is medium. Permeability is rapid to moderately rapid in the surface layers and slow to very slow in the subsoils. Natural fertility is low to medium, and organic matter content is low."

"cH2O", "6w3", "In normal years these hydric soils have a seasonal high water table within 6 inches of the surface for 2 to 6 months or more. In other months the water table is usually below these depths. These soils are also ponded frequently for long duration with water approximately 2 feet above the surface. Most often ponding occurs in the winter and spring, but it may occur during any wet season."

"dCUL", "6w3", "These soils are not suited to cultivated crops without extensive water table and ponding control management systems. Wetness, restricted rooting zone, slow internal drainage, and difficulty in obtaining adequate drainage outlets severely limit their use for cultivated crops. Water table management systems are hard to establish and maintain."

"eERO", "6w3", "Erosion is not a management concern on crops produced on these hydric soils if they happen to be cultivated."

"fIRR", "6w3", "If cultivated, highest yields require irrigation either subirrigated through the extensive water table management system or by sprinklers."

"hPAS", "6w3", "These hydric soils are not suited to pasture or hay crops without an extensive water table management system."

"iWMG", "6w3", "Because of the slow internal movement of water, and the usual lack of good outlets in areas where these soils occur, good water table management systems are difficult to establish and maintain. These systems normally require an extensive system of canals and ditches. A diking and/or pumping system for control of ponding water is also needed."

6w4 Hydric phase of Map Unit Ab

"aSOI", "6w4", "This capability unit consists of nearly level, very poorly drained soils that occur on flood plains. These soils are mineral soils. "

"bSAC", "6w4", "The root zone is restricted by a water table that is at or above the surface during wet seasons. The internal drainage is slow and response to artificial drainage is poor. The available water capacity is medium. Permeability is rapid to moderately rapid in the surface layers and slow to very slow in the subsoils. Natural fertility is low to medium, and organic matter content is low."

"cH2O", "6w4", "In normal years these hydric soils have a seasonal high water table within 6 inches of the surface for 2 to 6 months or more. In other months the water table is usually below these depths. These soils are also flooded frequently for long duration. Most often flooding occurs in the spring and summer, but it may occur during any wet season."

"dCUL", "6w4", "These soils are not suited to cultivated crops without extensive water table and flood control management systems. Wetness, restricted rooting zone, slow internal drainage, and difficulty in obtaining adequate drainage outlets severely limit their use for cultivated crops. Water table management systems are hard to establish and maintain."

"eERO", "6w4", "Erosion is not a management concern on crops produced on these hydric soils if they happen to be cultivated."

"fIRR", "6w4", "If cultivated, highest yields require irrigation either subirrigated through the extensive water table management system or by sprinklers."

"hPAS", "6w4", "These hydric soils are not suited to pasture or hay crops without an extensive water table management system."

"iWMG", "6w4", "Because of the slow internal movement of water through the subsoils, and usually the lack of good outlets in areas where these soils occur, good water table management systems are difficult to establish and maintain. These systems normally require an extensive system of canals and ditches. A diking and/or pumping system for control of flood waters is also needed. "

7e1 Map Units AtF(Nankin), CsF, FsF, FsF3, Gu, LtF(Nankin), SrF, SsF

"aSOI", "7e1", "This map unit consists of moderately steep to steep soils on side slopes of upland ridges. The soils have less than 20 inches of sandy or loamy surface layers over loamy or clayey subsoils. In places where protective cover has been removed, the soils have eroded severely and contain many rills and gullies. Vegetation often hides these rills and gullies. Limestone boulders may outcrop in some places."

"bSAC", "7e1", "The root zone of these soils is deep or moderately deep and well aerated. The available water capacity is moderate within the root zone and natural fertility is low to moderate. The hazard of erosion is very severe on unprotected areas."

"cH2O", "7e1", "In normal years these soils do not have a seasonal high water table within 72 inches of the surface."

"dCUL", "7e1", "These soils are too steep and erodible to be suited to cultivated crops."

"eERO", "7e1", "If these soils are cultivated, erosion control measures that would adequately protect the soil and water resource base are difficult to install and/or maintain."

"fIRR", "7e1", "Due to the lack of cultivation, irrigation is not a normal practice on these soils."

"hPAS", "7e1", "These soils are poorly suited to pastures due to steepness of the soil and the hazard of erosion."

"iWMG", "7e1", "Water table management is not a normal practice on these soils because of the lack of cultivation and an available water source."

7s9 Map Units AtF(Troup), LsF, LtF(Troup), RtF, RtF3(Lucy)

"aSOI", "7s9", "This map unit consists of moderately steep to steep soils on side slopes of upland ridges. They have sand layers 20 to 70 inches over loamy subsoils."

"bSAC", "7s9", "These soils have a deep root zone to depths of more than 80 inches. The available water capacity is low in the root zone. Natural fertility is very and response to fertilization is low. Rainfall is rapidly absorbed but moves rapidly through the soil and very little is retained. There is very severe hazard of sheet, rill and gully erosion."

"cH2O", "7s9", "In normal years these soils do not have a seasonal high water table within 72 inches of the surface."

"dCUL", "7s9", "These soils are too steep and erodible to be suited to cultivated crops."

"eERO", "7s9", "If these soils are cultivated, erosion control measures that would adequately protect the soil and water resource base are difficult to install and/or maintain."

"fIRR", "7s9", "Due to the lack of cultivation, irrigation is not a normal practice on these soils."

"hPAS", "7s9", "These soils are poorly suited to pastures due to steepness of the soil and the hazard of erosion."

"iWMG", "7s9", "Water table management is not a normal practice on these soils because of the lack of cultivation and an available water source."

8e1 Map Units Mp, RtF3(Gullied Land)

"aSOI", "8e1", "This map unit consists of areas where soil materials have been removed by severe erosion, excavation or mining operations. Some of these areas fill with water periodically and other areas have geologic materials exposed. "

"bSAC", "8e1", "Due to infertile exposed geologic soil material, these areas are not vegetated."

"cH2O", "8e1", "These soils have a highly variable water table."

"dCUL", "8e1", "Due to the infertile material, these soils are not suited to cultivated crops."

"eERO", "8e1", "Due to the lack of these soils being cultivated, erosion control is not a management concern."

"fIRR", "8e1", "Due to the lack of cultivation, irrigation is not a normal practice on these soils."

"hPAS", "8e1", "Due to the infertile material, these soils are not suited to hay and pasture."

"iWMG", "8e1", "Water table management is not a normal practice on these soils because of the lack of cultivation."

ECOLOGICAL COMMUNITIES

kRNG - Rangeland (not developed, no significant application in the area served by this field office.)

IWLD - Wildlife

mWOD - Woodland

Longleaf Pine-Turkey Oak Hills - Map Units BcB*, EcB, EcD, EdB, EmB, EmC, KsB*, KsC*, LaB, LaD, LcB, LcD, LsF, LtC*, LtD*, LtF*

("IWLD", "04") "This ecological community is suited for deer and turkey, especially as escape cover. Many birds inhabit the area including warblers, towhees, flycatchers, scrub jays, and quail. Several varieties of native legumes furnish food (seeds) for the birds. Timber harvest and other disturbances increase wildlife food by increasing the amount and types of herbaceous plants and by sprout production."

("mWOD", "04") "This community has a moderately high potential for commercial production of pulp and timber. These soils create moderate equipment limitations and seedling mortality problems. Sand pine and longleaf pine are the commercial species suited to planting."

Mixed Hardwood And Pine - Map Units AdB,AdC,AfD,AfF,BaC, BcB*,BfB,BfC,BtB,CaC3,CnA,CnB,CnB2,CnC,CnC2,CnD,CrB,CrC,CsD,CsF, EsA,EsB,EsC,FaC3,FaD3,FmA,FmB,FmB2,FmC,FmC2,FmD,FsD,FsD3,FsF, FsF3,GoA,GoB,GmA,GmB,GmC,Gu,Ha,Ig,KaA,KbA,KbB,KcB,KsB*,KsC*,LdB, LdD,LeA,LeB,LmC,LnB,LnD,LtC*,LtD*,LtF*,LyA,LyB,LzA,LzB,MfB3,MfC3, MfD3,MgA,MgA2,MgB,MgB2,MgC,MgC2,MgD,NfA,NfB,NfB2,NfC,NfC2,NfD, NpA,NpB,NpB2,NsA,NsB,NsC,NsD,NtA,NtB,NtC,OfA,OfB,OfB2,OfC,OfC2, OfD,OtA,OtB,OtC,OtD,PcA*,PhA,PhB,RbB3,RbC3,RbD3,ReA,ReB,ReB2,ReC,Re C2,ReD,RfC3,RmA,RmB,RmB2,RmC,RmC2,RmD,RsA,RsB,RsC,RsD,RtC,RtD, RtF,RtF3,RbB,SaB,SaC,ShB,SnB,SnC,SrD,SrF,SsD,SsF,TfA,TfB,TfB2, TfC2,ZuB,ZuC

("IWLD", "05") "This community offers very good habitat for deer, turkey, squirrel, and many songbirds. Hardwood mast (acorns, nuts, fruits, buds, berries) furnish a good source of wildlife food. Mature hardwoods and snags provide good nesting sites for birds. Habitat is good for raccoons, opossums, bobwhite quail and dove, fair for reptiles, and poor for most amphibians."

("mWOD", "05") "This community has a high potential productivity for commercial wood production. There are no serious management problems. Slash pine and loblolly pine are the commercial species suited to planting."

North Florida Flatwoods - Map Units Lw,PcA*,PsA,PsB*

("IWLD", "07") "The North Florida Flatwoods community is well suited for deer, quail and turkey. It is fair for squirrels and well suited for many songbirds, particularly warblers. It is also well suited for bobcat, skunks, opossums, and raccoons. It is poorly suited for dove."

("mWOD", "07") "This community has a moderate potential productivity for commercial wood production. There are moderate equipment limitations and seedling mortality due to wet soil conditions. The commercial species suitable for planting is slash pine."

Cypress Swamp - Map Units Gr*,Pt*,Ra*,RuA*

("IWLD", "17") "This community is very important for wildlife refuge areas and as a turkey roosting area. It is well suited for waterfowl and wading birds. Aquatic animals may be found in large numbers. The permanent residents of cypress heads are relatively few, but much of the wildlife of the flatwoods is dependant on these ponds for breeding purposes."

("mWOD", "17") "Commercial wood production is not recommended. Extensive drainage would be required, thereby destroying this community."

Bottom Land Hardwoods - Map Units Ab,Co,HcB,Lv,MyB,PsA*,Sw

("IWLD","20") "This community host a large variety of wildlife. It is well suited for squirrel, deer, and birds such as chickadees, titmice, flycatchers, owls, towhee, turkey, vireos, warbler, cedar waxwing, woodpeckers and wren. The various species of hardwood vegetation provide good food and cover for these species."

("mWOD","20") "This community has a high potential productivity for commercial woodland production on areas with adequate surface drainage. There are severe equipment limitations and seedling mortality due to the poorly to very poorly drained soil conditions. Slash and loblolly pine are suitable for planting in areas with adequate surface drainage. Most areas are better suited to natural regeneration."

Swamp Hardwoods - Map Units Gr*,Pt*,Ra*,RuA*

("IWLD","21") "This community hosts a large variety of wildlife. It is especially well suited for waterfowl, reptiles, amphibians, and mammals. Animals found in this community must withstand the flooding which occurs periodically. Gray squirrel, mink, raccoon, and river otter are the most commonly found mammals. Many birds inhabit this area including chickadees, titmice, yellow-billed cuckoo, wood duck, limpkin, flycatchers, owls, turkey, woodcock, hooded warbler, cedar waxwing, woodpeckers, and wren. The various species of hardwood vegetation provide good food and cover for these species."

("mWOD","21") "This Swamp Hardwoods community is generally not used for commercial woodland production except for limited harvest of hardwoods. However, this community does have a high potential for commercial woodland production on areas with adequate surface drainage. There are severe equipment limitations and seedling mortality due to the poorly to very poorly drained soil conditions. Slash pine is suitable for planting in areas with adequate surface drainage. "

Shrub Bogs-Bay Swamps - Map Unit PsB*

("IWLD","22") "This ecological community's primary value to game animals is the escape cover furnished to deer, turkey, and quail by the thick growth. This cover is also good habitat for a variety of frogs, salamanders, crayfish, predatory snakes, and raccoon."

("mWOD","22") "This ecological community is generally not used for commercial woodland production except for limited harvest of hardwoods. However, this community does have a high to moderate potential for commercial woodland production on areas with adequate surface drainage. There are severe equipment limitations and seedling mortality due to the poorly to very poorly drained soil conditions. Slash pine is suitable for planting in areas with adequate surface drainage. "

* - These Map Units have more than one type of Ecological Community.

URBAN USES

oURB - Urban Use Statement

Map Units Ab, Co, Gr, Ha, HcB, KaA, Lv, MyB, Pt, Ra, RuA, and Sw

"AREA 1 oURB GROUP", "A101", "Soils in this group have severe limitations for urban uses. Seasonal flooding or ponding is the primary limiting factor. Additionally, other severely limiting factors probably will be present in these soils."

Map Units BtB, Ig, KbA, KbB, KsB, LeA, LeB, Lw, LyA, LzB, PcA, PhA, PhB, PsA, PsB, RbB, SaB, SaC, and ZuB

"AREA 1 oURB GROUP", "A102", "Soils in this group have severe limitations for most urban uses. A seasonal high water table saturating these soils at or near the surface is the primary limiting factor. Additionally, other severely limiting factors may be present in these soils."

Map Units BaC, CrB, CrC, ShB, SnB, and SnC

"AREA 1 oURB GROUP", "A103", "Soils in this group have moderate to severe limitations for most urban uses. Limitations resulting from the properties of clayey layers within these soils dominate this group. Additionally, other limiting factors may be present in these soils."

Map Units CaC3, CnA, CnB, CnB2, CnC, CnC2, GoA, GoB, GmA, GmB, GmC, LyB, NfA, NfB, NfB2, NfC, NfC2, NpA, NpB, NpB2, TfA, TfB, TfB2, TfC2, and ZuC

"AREA 1 oURB GROUP", "A104", "Soils in this group have moderate limitations for many urban uses. Soil properties related to texture and wetness primarily affect this group. Soils of this group may have severe limitations for a specific urban use."

Map Units AdB, AdC, BcB, BfB, BfC, EcB, EdB, EmB, EmC, EsA, EsB, EsC, FaC3, FmA, FmB, FmB2, FmC, FmC2, KcB, KsC, LaB, LcB, LdB, LmC, LnB, LtC, MfB3, MfC3, MgA2, MgB, MgB2, MgC, MgC2, NsA, NsB, NsC, NtA, NtB, NtC, OfA, OfB, OfB2, OfC, OfC2, OtA, OtB, OtC, RbB3, RbC3, ReA, ReB, ReB2, ReC, ReC2, RfC3, RmA, RmB, RmB2, RmC, RmC2, RsA, RsB, RsC, and RtC

"AREA 1 oURB GROUP", "A105", "Soils in this group have slight limitations for many urban uses. Soils of this group may have moderate or even severe limitations for a specific urban use. Soil properties related to texture, slope, or wetness may affect a specific urban use."

Map Units AfF, CsF, FsF, FsF3, Gu, LsF, LtF, RtF, RtF3, SrF, and SsF

"AREA 1 oURB GROUP", "A106", "Soils in this group have severe limitations for urban uses. Moderately steep to very steep slopes is the primary limiting factor. Additionally, other severely limiting factors may be present in these soils such as texture or shallow depth to rock."

Map Units AfD, CnD, CsD, EcD, FaD3, FmD, FsD, FsD3, LaD, LcD, LdD, LnD, LtD, MfD3, MgD, NfD, NsD, OfD, OtD, RbD3, ReD, RmD, RsD, RtD, SrD, and SsD

"AREA 1 oURB GROUP", "A107", "Soils in this group have moderate limitations for urban uses. Slope is the primary limiting factor. Additionally, other moderately limiting factors may be present in these soils such as texture or shallow depth to rock."

WATER QUALITY: PESTICIDE AND NUTRIENT MANAGEMENT

sWQ – Water Quality Statement

tPES- Pesticide Management Statement

uNUT – Nutrient Management Statement

Map Units - (None)

"sWQ", "01", "These soils have a low potential for pesticide leaching to groundwater and a low potential for pesticide runoff to surface water. They have a medium or high potential for nitrogen leaching to groundwater and a low potential for phosphorous runoff to surface runoff."

"tPES", "01", "The Florida Pest Control Guide contains a listing of pesticides suitable for each type of pest and is available from the Cooperative Extension Service. Read and follow pesticide labels."

"uNUT", "01", "A soil test will be used as a guide to determine plant nutrient needs. In addition, a listing of nitrogen and phosphorous requirements by crop type is available from the Cooperative Extension Service. Nutrients should be added at the rate needed by the crop grown or according to the producer's goals, whichever is lower."

Map Units - AdB,AdC,AfD(Blanton),EcB,EcD,EdB,EmB,EmC,EsA,EsB,EsC,GmA,GmB,GmC,HcB,KcB,KsC,LaB,LaD,LcB,LcD,LdB,LdD,LmC,LnB,LnD,LtC(Troup),LtD(Troup),NsA,NsB,NsC,NsD,NtA,NtB,NtC,OtA,OtB,OtC,OtD,RsA,RsB,RsC,RsD,RtC(Troup),RtD(Troup)

"sWQ", "02", "These soils have a medium or high potential for pesticide leaching to the groundwater and a low potential for pesticide runoff from the field(s) to surface water. They have a medium or high potential for nitrogen leaching to the groundwater and a low potential for phosphorous runoff to surface runoff."

"tPES", "02", "The Florida Pest Control Guide from the Cooperative Extension Service contains a list of pesticides suited to each pest. This list also contains Relative Leaching Potential Index (RLPI) values. While any approved pesticide listed in the guide can be used, the applicator should consider for use pesticides with a larger RLPI value and Health Advisory Level (HAL or HALEQ) value. Read and follow pesticide labels."

"uNUT", "02", "A soil test will be used as a guide to determine plant nutrient needs. In addition, a listing of nitrogen and phosphorous requirements by crop type is available from the Cooperative Extension Service. Nutrients shall be added at the rate needed by the crop grown or according to the producer's goals, whichever is lower."
