

# Soil Field Guide for Identifying Ecological Sites

**Version 1.4, 2006**

# FOREWORD

The “Soil Field Guide for Identifying Ecological Sites” was designed for on-site use by individuals with limited soils experience. Knowledge of “Texture by Feel Method” and several key soil features will enable users to assign ecological sites. Soils are defined by a range in characteristics that change gradually over the landscape. Determining where to examine the soil will greatly influence your outcome. Always choose a representative site within the area of investigation.

*“The U.S. Department of Agriculture (USDA) prohibits discrimination in all its programs and activities on the basis of race, color, national origin, age, disability, and where applicable, sex, marital status, familial status, parental status, religion, sexual orientation, genetic information, political beliefs, reprisal, or because all or a part of an individual’s income is derived from any public assistance program. (Not all prohibited bases apply to all programs.) Persons with disabilities who require alternative means for communication of program information (Braille, large print, audio-tape, etc.) should contact USDA’s TARGET Center at (202) 720-2600 (voice and TDD). To file a complaint of discrimination, write USDA, Director, Office of Civil Rights, Room 326-W, Whitten Building, 1400 Independence Avenue, SW, Washington, D.C. 20250-9410 or call (800) 795-3272 (voice) or (202) 720-6382 (TDD). USDA is an equal opportunity provider and employer.”*

Wet Meadow (WM)	yes	no	Wet Meadow							

1 No range site assigned. Soils in this ecological site were originally included in other range sites.

2 Soils in Shallow range site are now separated into Shallow Loamy, Shallow Sandy and Shallow Clayey ESD

This table indicates the Ecological Site Descriptions (ESD) presently identified in North Dakota by Major Land Resource Areas (MLRA), the accepted abbreviation for the ecological site and the correlation to the previous range site name (if any). ESDs are not completed for all MLRAs. For MLRAs without approved ESDs, use the existing range site description.

Ecological Site (abbreviation)	MLRA										Original Range Site name
	53A	53B	54	55A	55B	56	58C	58D			
Clayey (Cy)	yes	yes	yes	yes	yes	yes	yes	yes	yes	yes	Clayey

## Using the Field Guide

The field guide arranges ecological sites in a hierarchy of ecological groups. Utilizing the criteria below, **determine the ecological group using the first match starting with Group 1**. If a field site does not correspond with Groups 1-5, consider the site in the Loamy Ecological Group. Ecological sites are determined within each group using ecological site criteria.

<u>Criteria</u>	<u>Ecological Group</u>
Somewhat poorly to very poorly drained sites	High Water Table Ecological Group #1, Page 6
Shallow or Very Shallow sand/gravel or weather bedrock (within 20 inches)	Shallow and Very Shallow Ecological Group #2, Page 8
Presence of a claypan	Claypan Ecological Group #3, Page 10
Surface and subsoil layers form a <1-inch ribbon and soil feels very gritty when excessively wet	Sandy Ecological Group #4, Page 12
Subsoil forms a 2-inch or longer ribbon	Clayey Ecological Group #5, Page 16
Soils that do not fit the above criteria	Loamy Ecological Group #6, Page 18

\* Sand Particle size should be estimated (very fine, fine, medium, coarse) for these textures. Individual grains of very fine sand are not visible without magnification and there is a gritty feeling to a very small sample ground between the teeth. Some fine sand particles may be just visible. Medium sand particles are easily visible. Examples of sand size descriptions where one size is predominant are: very fine sand, fine sandy loam, loamy coarse sand.

\*\* Clay percentage range.

Modified from: Thien, Steven J., Kansas state University, 1979 Jour. Agronomy education.

# Determining Soil Texture by the "Feel Method"

**NOTES:**

**GROUP #1**  
**High Water Table Ecological Group**

**Ecological Group Criteria**

- **Landscape** – depressions on uplands or floodplains and drainageways
- **Bedrock** – very deep
- **Carbonates** – allowable
- **Claypan** – allowable
- **Drainage** – **somewhat poorly to very poorly**
- **Flooding** – occasional or frequent  
(*Closed Depression Ecological Site* is ponded)
- **Salinity** – none to strongly saline
- **Texture** – NA

Saline Soil – A soil containing sufficient soluble salts to adversely affect vegetative growth and species adaptation. Salts may be identified in the soil as threads or spherical concentrations that do not react with 1N hydrochloric acid (HCL). Boundaries are sharp and concentrations are white in color. The salinity levels in the surface layers must be moderately saline (8 - 16 mmhos/cm) or strongly saline ( $\geq 16$  mmhos/cm) to meet criteria of *Saline Lowland Ecological Site*.

Soil Profile – a vertical section of the soil extending through all its horizons and into the parent material

Typical Soil Horizonation

Surface layer (e.g., topsoil)	A, Ap, Ak
Subsoil	Bw, Bt, Btn, Bk
Substratum or Bedrock	C, Cr

## GLOSSARY (Cont.)

7. Very poorly drained – water table is 1.0 foot above to 1.0 feet below the soil surface. Water is removed from the soil so slowly that free water remains at or very near the surface.

**Flooding** – The temporary covering of the soil surface by **flowing water**.

1. Frequently Flooded – flooding is likely to occur often under usual weather conditions: more than a 50 percent chance of flooding in any year.
2. Occasional Flooding – flooding is expected infrequently under usual weather conditions: 5 to 50 percent chance of flooding in any year or ground surface during much of the growing season 5 to 50 times in 100 years.
3. Rarely Flooded – flooding is unlikely but possible under unusual weather conditions; 1 to 5 percent chance of flooding in any year or nearly 1 to 5 times in 100 years.

**Ponding** – The covering of the soil surface by **stagnant water**.

**Sand and Gravel** – *Shallow and Very Shallow Ecological Site* uses the term “shallow and very shallow” to describe the depth of sand and gravel. The depth is described below: The term “gravelly” is used to describe the subsoil material which contains varying percents of sand and gravel.

### Depth

- Very Shallow – < 14 inches
- Shallow – 14 to 20 inches

## Ecological Site Criteria

**Review all ecological sites within this group and choose the best match.**

***Closed Depression Ecological Site*** – the sites are **poorly drained** and occur on **closed upland depressions**. The subsoil layer exhibits **claypan characteristics** and **forms a 2-inch or longer ribbon (silty clay to clay)**. These areas may pond water but do not flood. (MLRA 54)

***Limy Subirrigated*** – the sites are **somewhat poorly drained and have strong to violent effervescence in the subsoil**. They are on floodplains, drainage ways, and around or between depressions.

***Saline Lowland Ecological Site*** – the sites are **somewhat poorly to poorly drained and moderately to strongly saline**. The salinity can be observed in the surface or subsoil layers.

***Subirrigated Ecological Site*** – the sites are **somewhat poorly drained** and are on floodplains, drainage ways and alluvial areas.

***Wet Meadow Ecological Site*** – the sites are **poorly drained** and in **depressions or floodplains**.

***Wet Land Ecological Site*** – the sites are **very poorly drained**.

## GROUP #2

### Shallow and Very Shallow Ecological

or

### Ecological Group Criteria

- Landscape – upland
- **Bedrock** – shallow and very shallow
- Carbonates – none to strong
- Claypan – none
- Drainage – well to somewhat excessive
- Flooding – none
- **Gravel** – shallow to very shallow
- Salinity – none to slight
- Texture – NA

Drainage – The field key refers to “High Water Table Ecological Groups” which uses drainage classes to distinguish between several sites influenced by ground water. Water tables are determined by the depth to free water and duration (significant periods during the growing season).

1. Excessively drained – Water table is >5 feet from the soil surface. These soils have very high hydraulic conductivity and low water holding capacity.
2. Somewhat excessively drained – Water table is > 5 feet from the soil surface. These soils have high hydraulic conductivity and low water holding capacity.
3. Well drained – Water table is > 5 feet from the soil surface. Water is available to plants most of the growing season. Wetness does not inhibit growth of roots.
4. Moderately well drained – Water table is 3.5 to 5 feet below the soil surface. Water is removed somewhat slowly during some periods of the year. Soil are wet for only short time within the rooting depth.
5. Somewhat poorly drained – Water table is 1.5 to 4 feet below the soil surface. Water is removed slowly so that the soil is wet at a shallow depth for significant periods during the growing season.
6. Poorly drained – Water table is 1.0 foot above to 1.5 feet below the soil surface. Water is removed so slowly that the soil is wet at shallow depths periodically during the growing season or remains wet for long periods of time.

## GLOSSARY

**Bedrock** – Most bedrock in North Dakota is soft and weathered. Common types are sandstone, siltstone, and shale. Weathered bedrock has a platy appearance which fractures horizontally. The depth to bedrock is described below:

### Depth

- Very Shallow – < 10 inches
- Shallow – 10 to 20 inches
- Moderately deep – 20 to 40 inches
- Deep – 40 to 60 inches
- Very deep – > 60 inches

**Calcareous (limy) Soil** – Soil containing sufficient free CaCO<sub>3</sub> (lime) to effervesce (gaseous response seen as bubbles) visibly when treated with 0.1 N hydrochloric acid (HCL) (obtain from soil scientist). Site key will address amounts and depth of carbonates.

- Non Effervescent – no bubbles form
- Slight Effervescent – numerous bubbles form
- Strong Effervescent – bubbles form low foam
- Violent Effervescent – bubbles form a thick foam

**Claypan** – A dense, compact layer in the subsoil having much higher clay content than the overlying material. It is separated by a sharply defined boundary. In undisturbed areas, the soil structure in the subsoil is columnar in shape. They are vertical elongated soil peds with very distinct and normally rounded tops. They usually impede movement of water, air, and the growth of plant roots.

## Ecological Site Criteria

**Review all ecological sites within this group and choose the best match.**

**Shallow Clayey Ecological Site** – soils are **shallow (10 to 20 inches) to weathered bedrock, shale or strongly cemented silicrete. The subsoil or substratum (not including the weathered bedrock) forms a > 2 inch ribbon (silty clay loam to clay).** The surface layer is from 1 to 6 inches thick.

**Shallow Gravel Ecological Site** – soils are **shallow (14 to 20 inches) to sand and gravel.** The substratum contains up to 60 percent gravel and/or 25 to 75 percent sand.

**Shallow Loamy Ecological Site** – soils are **shallow (10 to 20 inches) to weathered bedrock, shale or strongly cemented silicrete. Surface and substratum layers form a < 2-inch ribbon (silt loam to clay loam).**

**Shallow Sandy Ecological Site** – **surface and substratum layers will form a < 1-inch ribbon and feels very gritty when excessively wet or will not ribbon but forms a ball.** These soils are **shallow (10 to 20 inches) to weathered bedrock or hard sandstone bedrock or are shallow (14 to 20 inches) to sand and gravel.**

**Very Shallow Ecological Site** – soils are **very shallow (< 10 inches) to soft weathered bedrock or very shallow (< 14 inches) to sand and gravel or shallow (10 to 20 inches) to porcellanite.**

## GROUP #3 Claypan Ecological Group

### Ecological Group Criteria

- **Landscape** – till plains, uplands, and terraces
- **Bedrock** – very deep and moderately deep
- **Carbonates** – none to slight effervescence
- **Claypan** – **yes**
- **Drainage** – well or moderately well
- **Flooding** – none
- **Salinity** – may be evident (see Ecological Site Criteria)
- **Texture** – NA

### Ecological Site Criteria

**Review all ecological sites within this group and choose the best match.**

***Loamy Ecological Site*** – surface layer forms a < 2-inch ribbon (silt loam, loam). Subsoil layers form a < 2-inch ribbon (silt loam to clay loam). These sites are on **uplands**.

***Loamy Overflow Ecological Site*** – surface layer forms a < 2-inch ribbon (silt loam, loam). Subsoil layer forms a < 2-inch ribbon (silt loam to clay loam). These sites are in floodplains or swale positions of complex map units on slopes of < 6 percent. **Include soils that are frequently flooded.**

***Loamy Terrace Ecological Site*** – surface layer forms a < 2-inch ribbon (silt loam, loam). Subsoil layer forms a < 2-inch ribbon (silt loam to clay loam). These sites are on low terraces or floodplains and **may be occasionally flooded.**

***Thin Loamy Ecological Site*** – surface layer forms a < 2-inch ribbon (silt loam, loam). Subsoil layer forms a < 2-inch ribbon (silt loam to clay loam). These soils are none to strongly effervescence in the surface layer and strong to violent effervescence in the subsoil. In MLRA 54, soils may be calcareous to the surface (slight to strong effervescence). These sites are on uplands.

## GROUP #6 Loamy Ecological Group

### Ecological Group Criteria

- **Landscape** – floodplain, till plains and uplands
- **Bedrock** – very deep to moderately deep
- **Carbonates** – Loamy, *Loamy Overflow*, and *Loamy Terrace Ecological Sites* - soils may contain carbonates to the surface (slight effervescence). *Thin Loamy Ecological Site* soils have violent effervescence in the subsoil.
- **Claypan** – none
- **Drainage** – well or moderately well
- **Flooding** – **Frequent:** include in *Loam Overflow Ecological Site*  
**Occasional:** include in *Loamy Terrace Ecological Site*
- **Salinity** – none to very slight
- **Texture** – **Surface layer is 5 to 20 inches thick and textures are loam (soil neither dominated by gritty nor smooth) and silt loam (soil feels very smooth). The subsoils range from silt loam to clay loam.**

## Ecological Site Criteria

**Review all ecological sites within this group and choose the best match.**

*Claypan Ecological Site* – surface layer ranges from 6 to 14 inches. The subsoil layer exhibits **claypan characteristics and forms a 1-inch or longer ribbon (clay loam to clay)**. Salinity may be evident at depths > 16 inches.

*Thin Claypan Ecological Site* – surface layer ranges from 0 to 6 inches. The subsoil layer exhibits **claypan characteristics and forms a 2-inch or longer ribbon (silty clay to clay)**. Salinity may be evident at depths < 16 inches.

*Sandy Claypan Ecological Site* – subsoil layer exhibits **claypan characteristics and forms a < 1-inch ribbon (fine sandy loam)**. Salinity may be evident at depths > 16 inches.

## GROUP #4 Sandy Ecological Group

### Ecological Group Criteria

- **Landscape** – Uplands (*Sandy Terrace Ecological Sites* are on low terraces/floodplains )
- **Bedrock** – very deep and moderately deep
- **Carbonates** – *Thin Limy Ecological Site* has strong effervescence in the subsoil layer
- **Claypan** – none
- **Drainage** – well to excessively well
- **Flooding** – none  
(*Sandy Terrace Ecological Sites* have none to occasional flooding)
- **Salinity** – none
- **Texture** – **Sandy**: surface and subsoil layers form a < 1-inch ribbon (feels very gritty when excessively wet) or forms a ball when squeezed  
**Sands**: soil may or may not remain in a ball when squeezed

### Ecological Site Criteria

Review all ecological sites within this group and choose the best match.

#### *Clayey Ecological Site -*

1. Surface layer(s) is 5 to 14 inches thick and textures are loam (soil neither dominated by gritty nor smooth) to clay (soil feels neither gritty nor smooth).
2. **Subsoil layer forms a 2-inch or longer ribbon (silty clay to clay).**

## GROUP #5 Clayey Ecological Group

### Ecological Group Criteria

- **Landscape** – uplands, alluvial plains and floodplains
- **Bedrock** – very deep to moderately deep
- **Carbonates** – none to slight (surface and subsoil)
- **Claypan** – none
- **Drainage** – well or moderately well
- **Flooding** – none
- **Salinity** – none to slight
- **Texture** – subsoil forms a 2-inch or longer ribbon

### Ecological Site Criteria

**Review all ecological sites within this group and choose the best match.**

***Sandy Ecological Site*** – surface and subsoil layers form a < 1-inch ribbon (fine sandy loam or sandy loam - feels very gritty when excessively wet). These sites are on uplands.

***Sandy Terrace Ecological Site*** – surface and subsoil layers form a < 1-inch ribbon (fine sandy loam, sandy loam - feels very gritty when excessively wet). These sites are on low terraces and floodplains and are none to occasionally flooded.

***Sands Ecological Site*** – surface and subsoil layers do not form a ribbon and may form a ball when squeezed (loamy fine sand to fine sand). These sites are on uplands.

***Limy Sands Ecological Site*** – surface and subsoil layers do not form a ribbon and may form a ball when squeezed (loamy fine sand to fine sand). Typically these sites are calcareous through out the soil profile (**slight to strong effervescence**) and are on uplands.

**Continued:**

**GROUP #4**  
**Sandy Ecological Group (Cont.)**

**NOTES:**

**Review all ecological sites within this group and choose the best match.**

*Subirrigated* – surface and subsoil layers do not form a ribbon and may form a ball when squeezed (loamy fine sand to fine sand). These sites are moderately well drained and on uplands.

*Thin Sands Ecological Site* – surface and subsoil layers do not form a ribbon and may form a ball when squeezed (loamy fine sand to fine sand). These sites are on floodplains, lake plains, outwash plains, residual plains and terraces. Typical landscapes are hummocks and dunes.
