

United States Department of Agriculture Natural Resources Conservation Service

Ecological Site Description

Site Type: Rangeland

Site Name: Igneous (Ig), 20"+ P.Z., High Mountains

Site ID: R043BY116WY

Major Land Resource Area: 43B-Central Rocky Mountains

Physiographic Features

This site occurs in an upland position on steep slopes. It is commonly found on ridge tops.

Landform: hill sides, ridges & escarpments

Aspect: commonly S and W

	<u>Minimum</u>	<u>Maximum</u>	
Elevation (feet):	6500	>12,000	
Slope (percent):	5	70	(mostly 30-55%)
Water Table Depth (inches):	none within 60 inches		
Flooding:			
Frequency:	none	none	
Duration:	none	none	
Ponding:			
Depth (inches):	0	0	
Frequency:	none	none	
Duration:	none	none	
Runoff Class:	low	high	

Climatic Features

Annual precipitation is fairly evenly distributed through the year and averages over 20 inches. Snows are heavy and usually remain in place during the winter. Annual snowfall averages 150 to 200 inches per year. Wide fluctuations may occur in yearly precipitation and result in more dry years than those with more than normal precipitation. Temperatures show a wide range between summer and winter and between daily maximums and minimums. This is predominantly due to the high elevation and dry air, which permits rapid incoming and outgoing radiation. Cold air outbreaks in winter move rapidly from northwest to southeast and account for extreme minimum temperatures.

Prevailing winds are from the southwest, and strong winds are less frequent than over other areas of Wyoming. Occasional storms, however, can bring brief periods of high winds with gusts exceeding 50 mph.

Growth of native cool season plants begins about June 1 at lower elevations, as late as July 15 at higher elevations, and continues until the beginning of September.

The following information is from the "Moran 5 WNW" climate station:

	<u>Minimum</u>	<u>Maximum</u>	<u>5 yrs. out of 10 between</u>
Frost-free period (days):	31	78	June 30 – August 24
Freeze-free period (days):	65	118	June 5 – September 9
Annual Precipitation (inches):	<20.78	>29.35 (2 years in 10)	

Mean annual precipitation: 25.23 inches

Mean annual air temperature: 36.5°F (22.1°F Avg. Min. to 50.9°F Avg. Max.)

For detailed information visit the Natural Resources Conservation Service National Water and Climate Center at <http://www.wcc.nrcs.usda.gov/cqibin/state.pl?state=wy> website. Other climate station representative of this precipitation zone include "Alta 1 NW", "Lake Yellowstone", "Moose", "Old Faithful", and "Snake River" in Teton County; "Bedford 3 SE" in Lincoln County; and "Bondurant" in Sublette County.

Influencing Water Features

<u>Wetland Description:</u>	<u>System</u>	<u>Subsystem</u>	<u>Class</u>	<u>Sub-class</u>
None	None	None	None	None

Stream Type: None

Representative Soil Features

The soils of this site are stony or cobbly and usually very shallow (less than 10" to igneous or volcanic bedrock). Some pockets of deep soil and areas of exposed bedrock may be included. This site is usually found on mountain sides.

Major Soil Series correlated to this site include:

Parent Material Kind: residuum
Parent Material Origin: granite, schist
Surface Texture: sandy loam, loamy sand, loam
Surface Texture Modifier: cobbly, stony, bouldery
Subsurface Texture Group: very cobbly sandy loam
Surface Fragments ≤ 3 " (% Cover): 10 to 25
Surface Fragments > 3 " (%Cover): 20-45
Subsurface Fragments ≤ 3 " (% Volume): 15-30
Subsurface Fragments > 3 " (% Volume): 30-45

	<u>Minimum</u>	<u>Maximum</u>
Drainage Class:	well	somewhat excessive
Permeability Class:	moderate	moderately rapid
Depth (inches):	4	10
Electrical Conductivity (mmhos/cm) ≤ 20 "	0	0
Sodium Absorption Ratio ≤ 20 "	0	0
Soil Reaction (1:1 Water) ≤ 20 "	5.6	7.2
Soil Reaction (0.1M CaCl ₂) ≤ 20 "	NA	NA
Available Water Capacity (inches) ≤ 30 "	0.25	1.0
Calcium Carbonate Equivalent (percent) ≤ 20 "	0	0

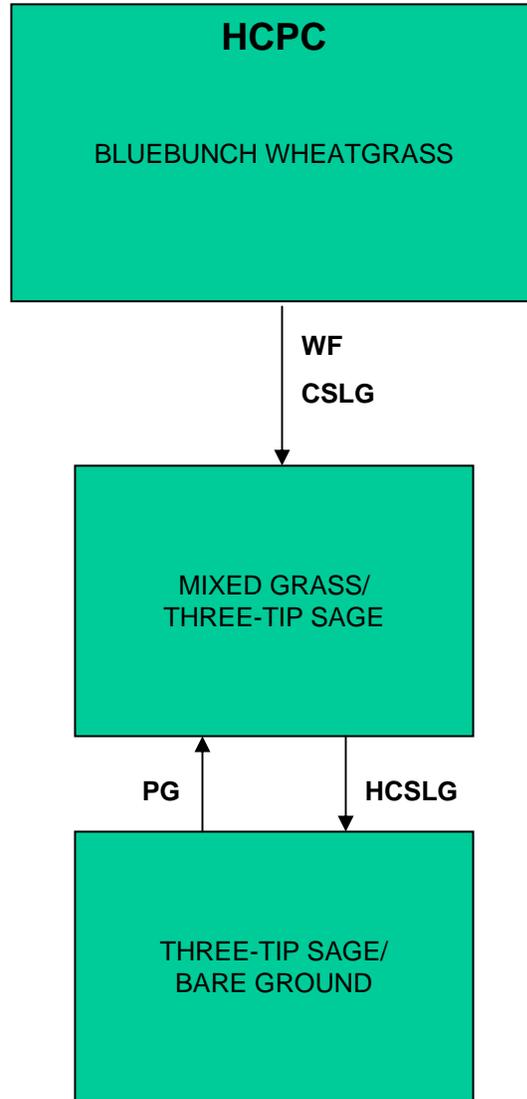

Plant Communities

Ecological Dynamics of the Site:

As this site deteriorates, species such as rhizomatous wheatgrass, three-tip sagebrush and bluegrasses will increase. Bluebunch wheatgrass will decrease in frequency and production. This site has relatively low productivity potential, and is not well suited to grazing improvement practices unless treated as part of a larger unit containing more productive areas.

The Historic Climax Plant Community (description follows the plant community diagram) has been determined by study of rangeland relic areas, or areas protected from excessive disturbance. Trends in plant communities going from heavily grazed areas to lightly grazed areas, seasonal use pastures, and historical accounts have also been used.

The following is a State and Transition Model Diagram that illustrates the common plant communities (states) that can occur on the site and the transitions between these communities. The ecological processes will be discussed in more detail in the plant community narratives following the diagram.

BMA – Brush Management (all methods)
 BMC – Brush Management (chemical)
 BMF – Brush Management (fire)
 BMM – Brush Management (mechanical)
 CSP – Chemical Seedbed Preparation
 CSLG – Continuous Season-long Grazing
 DR – Drainage
 CSG – Continuous Spring Grazing
 HB – Heavy Browse
 HCSLG – Heavy Continuous Season-long Grazing
 HI – Heavy Inundation
 LPG – Long-term Prescribed Grazing
 MT – Mechanical Treatment (chiseling, ripping, pitting)

NF – No Fire
 NS – Natural Succession
 NWC – Noxious Weed Control
 NWI – Noxious Weed Invasion
 NU – Nonuse
 P&C – Plow & Crop (including hay)
 PG – Prescribed Grazing
 RPT – Re-plant Trees
 RS – Re-seed
 SGD – Severe Ground Disturbance
 SHC – Severe Hoof Compaction
 WD – Wildlife Damage (Beaver)
 WF - Wildfire

Plant Community Composition and Group Annual Production

Bitterbrush	<i>Purshia tridentata</i>	PUTR2	8	0 - 33	0 - 5
Mountain big sagebrush	<i>Artemisia tridentata</i> ssp. <i>vaseyana</i>	ARTRV	8	0 - 33	0 - 5
Snowberry	<i>Symphoricarpos</i> spp.	SYMPH	8	0 - 33	0 - 5
other shrubs & half shrubs (native)		2SD/2SE/2TD/2TE	8	0 - 33	0 - 5

This list of plants and their relative proportions are based on near normal years. Fluctuations in species composition and relative production may change from year to year dependent upon precipitation or other climatic factors.

Plant Community Narratives

Following are the narratives for each of the described plant communities. These plant communities may not represent every possibility, but they probably are the most prevalent and repeatable plant communities. The plant composition tables shown above have been developed from the best available knowledge at the time of this revision. As more data is collected, some of these plant communities may be revised or removed, and new ones may be added. None of these plant communities should necessarily be thought of as “Desired Plant Communities”. According to the USDA NRCS National Range and Pasture Handbook, Desired Plant Communities (DPC’s) will be determined by the decision-makers and will meet minimum quality criteria established by the NRCS. The main purpose for including any description of a plant community here is to capture the current knowledge and experience at the time of this revision.

Bluebunch Wheatgrass Plant Community (HCPC)

The interpretive plant community for this site is the Historic Climax Plant Community. Potential vegetation is about 65% grasses or grass-like plants, 10% forbs, and 25% woody plants. The major grasses include bluebunch wheatgrass, big bluegrass, and timber oatgrass. Other grasses and grass-like plants include mutton and Canby bluegrass, thickspike wheatgrass, mountain muhly, bentgrass, spike fescue, mountain brome, Letterman and Columbia needlegrass, one-spike oatgrass, Idaho fescue, oniongrass, spike trisetum, and prairie junegrass. Major woody plants are black and three-tip sagebrush. Other woody plants include mountain big sagebrush, snowberry, and bitterbrush.

A typical plant composition for this state consists of bluebunch wheatgrass 30-40%, up to 10% big bluegrass, up to 10% timber oatgrass, other grasses and grass-like plants 10-20%, perennial forbs 5-15%, three-tip sagebrush 5-10%, black sagebrush 5-10%, and 5-15% other woody plants. Ground cover, by ocular estimate, varies from 15-25%.

The total annual production (air-dry weight) of this state is about 650 pounds per acre, but it can range from about 500 lbs./acre in unfavorable years to about 800 lbs./acre in above average years.

The following is the growth curve of this plant community expected during a normal year:

Growth curve number: WY0101

Growth curve name: 20+M, UPLAND SITES

Growth curve description: ALL UPLAND SITES

JAN	FEB	MAR	APR	MAY	JUN	JUL	AUG	SEP	OCT	NOV	DEC
0	0	0	0	5	30	40	20	5	0	0	0

(Monthly percentages of total annual growth)

The state is stable and well adapted to the Central Rocky Mountains climatic conditions. The diversity in plant species allows for high drought resistance. This is a sustainable plant community (site/soil stability, watershed function, and biologic integrity)

Transitions or pathways leading to other plant communities are as follows:

- Wildfire and Continuous Season-Long Grazing will convert this plant community to the *Mixed Grass/Three-tip Sage State*.

Mixed Grass/Three-Tip Sage Plant Community

This plant community is a result of severe disturbance such as wildfire, heavy grazing, or ground disturbing activities. Three-tip sage, low growing grasses, and annual forbs are significant components of this plant community.

The total annual production (air-dry weight) of this state is about 450 pounds per acre, but it can range from about 300 lbs./acre in unfavorable years to about 600 lbs./acre in above average years.

The following is the growth curve of this plant community expected during a normal year:

Growth curve number: WY0101

Growth curve name: 20+M, UPLAND SITES

Growth curve description: ALL UPLAND SITES

JAN	FEB	MAR	APR	MAY	JUN	JUL	AUG	SEP	OCT	NOV	DEC
0	0	0	0	5	30	40	20	5	0	0	0

(Monthly percentages of total annual growth)

The state is unstable and vulnerable to excessive erosion. However, rock fragment typically prevents serious erosion from occurring. The biotic integrity of this plant community is at risk depending on how far a shift has occurred in plant composition toward sprouting shrubs and annual forbs. The watershed is usually at risk or nonfunctioning due to an increase in bare ground.

Transitional pathways leading to other plant communities are as follows:

- Heavy Continuous Season-Long Grazing will convert this plant community to the *Three-tip Sage/Bare Ground State*.

Three-Tip Sage/Bare Ground Plant Community

This plant community is a result of long-term continued use and disturbance. Three-tip sage and bare ground dominate.

The total annual production (air-dry weight) of this state is about 250 pounds per acre, but it can range from about 100 lbs./acre in unfavorable years to about 400 lbs./acre in above average years.

The following is the growth curve of this plant community expected during a normal year:

Growth curve number: WY0101

Growth curve name: 20+M, UPLAND SITES

Growth curve description: ALL UPLAND SITES

JAN	FEB	MAR	APR	MAY	JUN	JUL	AUG	SEP	OCT	NOV	DEC
0	0	0	0	5	30	40	20	5	0	0	0

(Monthly percentages of total annual growth)

The state is unstable and vulnerable to excessive erosion. However, rock fragment typically prevents serious erosion from occurring. The biotic integrity of this plant community has been compromised. The watershed is usually nonfunctioning due to an increase in bare ground.

Transitional pathways leading to other plant communities are as follows:

- Prescribed Grazing will convert this plant community to the *Mixed Grass/Three-tip Sage State*.

Ecological Site Interpretations

Animal Community – Wildlife Interpretations

Bluebunch Wheatgrass Plant Community (HCPC): This plant community contributes important winter forage for mule deer and elk. It is not typically inhabited by burrowing animals due to the high volume of coarse fragments in the profile. It is mostly used by wildlife in transit to other habitats.

Mixed Grass/Three-Tip Sage Plant Community: This plant community exhibits a low level of plant species diversity. In most cases, it is not a desirable plant community to select as a wildlife habitat management objective.

Three-Tip Sage/Bare Ground Plant Community: This plant community exhibits a low level of plant species diversity. In most cases, it is not a desirable plant community to select as a wildlife habitat management objective.

N = not used; U = undesirable; D = desirable; P = preferred; T = toxic

- (a) Toxic in large amounts.
- (b) Poisonous in spring before flowering.
- (c) May be poisonous after seedpods mature.
- (d) Leaves are poisonous to sheep and cattle.
- (e) Young shoots are poisonous.

Animal Community – Grazing Interpretations

The following table lists suggested stocking rates for cattle under continuous season-long grazing under normal growing conditions. These are conservative estimates that should be used only as guidelines in the initial stages of the conservation planning process. Often, the current plant composition does not entirely match any particular plant community (as described in this ecological site description). Because of this, a field visit is recommended, in all cases, to document plant composition and production. More precise carrying capacity estimates should eventually be calculated using this information along with animal preference data, particularly when grazers other than cattle are involved. Under more intensive grazing management, improved harvest efficiencies can result in an increased carrying capacity. If distribution problems occur, stocking rates must be reduced to maintain plant health and vigor.

Plant Community	Production (lb./ac)	Carrying Capacity* (AUM/ac)
Bluebunch Wheatgrass (HCPC)	500-800	0.2
Mixed Grass/Three-Tip Sage	300-600	0.12
Three-Tip Sage/Bare Ground	100-400	0.06

* - Continuous, season-long grazing by cattle under average growing conditions.

Grazing by domestic livestock is one of the major income-producing industries in the area. Rangeland in this area may provide yearlong forage for cattle, sheep, or horses. During the dormant period, the forage for livestock use needs to be supplemented with protein because the quality does not meet minimum livestock requirements.

Hydrology Functions

Water is the principal factor limiting forage production on this site. This site is highly variable and is dominated by soils in hydrologic group B and C, with localized areas in hydrologic group D. Infiltration ranges from slow to very rapid. Runoff potential for this site varies from moderate to high depending on soil hydrologic group, slope, and ground cover. In many cases, areas with greater than 75% ground cover have the greatest potential for high infiltration and lower runoff. Areas where ground cover is less than 50% have the greatest potential to have reduced infiltration and higher runoff (refer to Part 630, NRCS National Engineering Handbook for detailed hydrology information.)

Rills and gullies may be present, but should be small. Water flow patterns should be barely distinguishable. Pedestals are only slightly present in association with bunchgrasses such as bluebunch wheatgrass. Litter typically falls in place, and signs of movement are not common. Chemical and physical crusts are rare to non-existent. Cryptogamic crusts are present, but only cover 1-2% of the soil surface.

Recreational Uses

This site provides limited hunting opportunities for upland game species.

Wood Products

No appreciable wood products are present on the site.

Inventory Data References (narrative)

Information presented here has been derived from NRCS clipping data and other inventory data. Field observations from range trained personnel were also used. Those involved in developing this site include: Bill Christensen, Range Management Specialist, NRCS; Karen Clause, Range Management Specialist, NRCS; and Everet Bainter, Range Management Specialist, NRCS. Other sources used as references include: USDA NRCS Water and Climate Center, USDA NRCS National Range and Pasture Handbook, and USDA NRCS Soil Surveys from various counties.
