

United States Department of Agriculture Natural Resources Conservation Service

Ecological Site Description

Site Type: Rangeland

Site Name: Wetland (WL), 20"+ P.Z., High Mountains

Site ID: R043BY178WY

Major Land Resource Area: 43B-Central Rocky Mountains

Physiographic Features

This site occurs on level or gently-sloping land near springs, seeps or sloughs.

Landform: drainageways, oxbows, and stream terraces

Aspect: all

	<u>Minimum</u>	<u>Maximum</u>	
Elevation (feet):	6500	>12,000	
Slope (percent):	0	10	(mostly <3%)
Water Table Depth (inches):	0	18	
Flooding:			
Frequency:	occasional	frequent	
Duration:	very brief	brief	
Ponding:			
Depth (inches):	0	12	
Frequency:	frequent	frequent	
Duration:	brief	very long	
Runoff Class:	negligible	high	

Climatic Features

Annual precipitation is fairly evenly distributed through the year and averages over 20 inches. Snows are heavy and usually remain in place during the winter. Annual snowfall averages 150 to 200 inches per year. Wide fluctuations may occur in yearly precipitation and result in more dry years than those with more than normal precipitation. Temperatures show a wide range between summer and winter and between daily maximums and minimums. This is predominantly due to the high elevation and dry air, which permits rapid incoming and outgoing radiation. Cold air outbreaks in winter move rapidly from northwest to southeast and account for extreme minimum temperatures.

Prevailing winds are from the southwest, and strong winds are less frequent than over other areas of Wyoming. Occasional storms, however, can bring brief periods of high winds with gusts exceeding 50 mph.

Growth of native cool season plants begins about June 1 at lower elevations, as late as July 15 at higher elevations, and continues until the beginning of September.

The following information is from the "Moran 5 WNW" climate station:

	<u>Minimum</u>	<u>Maximum</u>	<u>5 yrs. out of 10 between</u>
Frost-free period (days):	31	78	June 30 – August 24
Freeze-free period (days):	65	118	June 5 – September 9

Annual Precipitation (inches): <20.78 >29.35 (2 years in 10)

Mean annual precipitation: 25.23 inches

Mean annual air temperature: 36.5°F (22.1°F Avg. Min. to 50.9°F Avg. Max.)

For detailed information visit the Natural Resources Conservation Service National Water and Climate Center at <http://www.wcc.nrcs.usda.gov/cgibin/state.pl?state=wy> website. Other climate station representative of this precipitation zone include "Alta 1 NW", "Lake Yellowstone", "Moose", "Old Faithful", and "Snake River" in Teton County; "Bedford 3 SE" in Lincoln County; and "Bondurant" in Sublette County.

Influencing Water Features

Wetland Description:	<u>System</u>	<u>Subsystem</u>	<u>Class</u>	<u>Sub-class</u>
	Palustrine	None	Emergent Wetland	Persistent

Stream Type: C (Rosgen)

Representative Soil Features

The soils of this site are deep and poorly drained with a water table above the surface for part, but not all, of the growing season. They are nearly level to slightly depressional areas with poor surface drainage. Surface textures range from moderately coarse to fine, but commonly are medium and moderately fine with dark color and high organic content.

Major Soil Series correlated to this site include:

Parent Material Kind: alluvium

Parent Material Origin: mixed

Surface Texture: loam, clay loam, silty clay loam, thin peat layers common

Surface Texture Modifier: gravelly

Subsurface Texture Group: loam, clay loam, fine sandy loam, sandy clay loam

Surface Fragments ≤ 3" (% Cover): 0-20

Surface Fragments > 3" (%Cover): 0-5

Subsurface Fragments ≤ 3" (% Volume): 0-40

Subsurface Fragments > 3" (% Volume): 0-15

	<u>Minimum</u>	<u>Maximum</u>
Drainage Class:	very poorly	poorly
Permeability Class:	slow	moderate
Depth (inches):	20	>60
Electrical Conductivity (mmhos/cm) ≤20":	0	8
Sodium Absorption Ratio ≤20":	0	5
Soil Reaction (1:1 Water) ≤20":	6.1	8.4
Soil Reaction (0.1M CaCl2) ≤20":	5.6	7.3
Available Water Capacity (inches) ≤30":	2.25	6.0
Calcium Carbonate Equivalent (percent) ≤20":	0	15

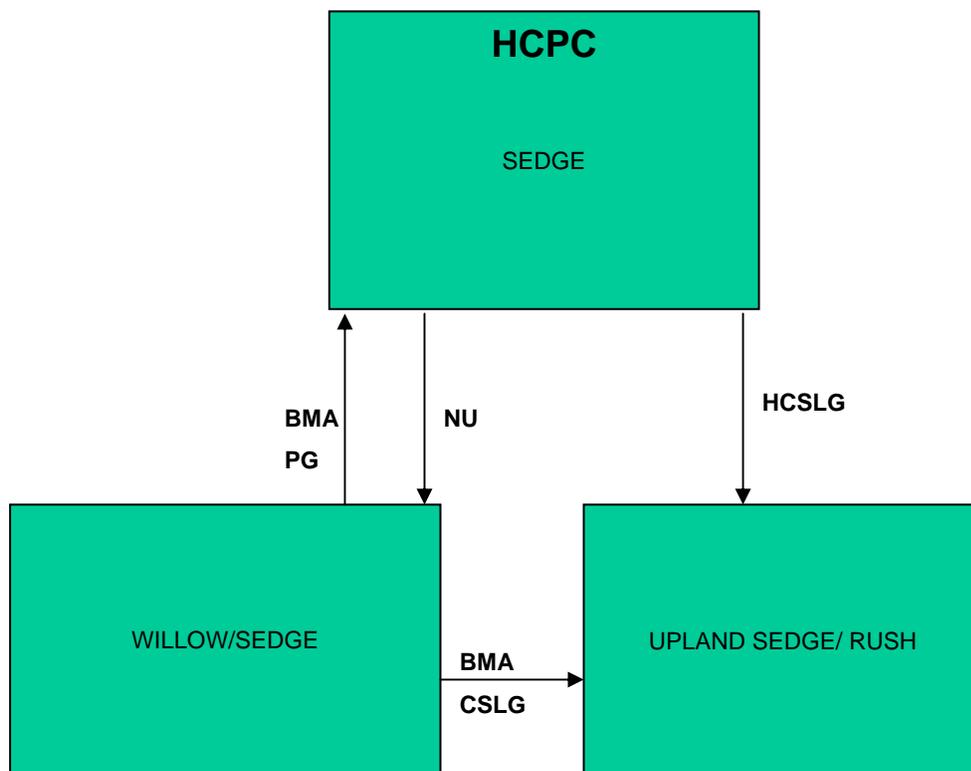

Plant Communities

Ecological Dynamics of the Site:

As this site deteriorates, species such as upland sedges and rushes increase. Grasses and grass-like plants such as Nebraska sedge, northern reedgrass, and tufted hairgrass will decrease in frequency and production. Willows and water birch, when present, will lose density and age diversity with heavy browsing.

The Historic Climax Plant Community (description follows the plant community diagram) has been determined by study of rangeland relic areas, or areas protected from excessive disturbance. Trends in plant communities going from heavily grazed areas to lightly grazed areas, seasonal use pastures, and historical accounts have also been used.

The following is a State and Transition Model Diagram that illustrates the common plant communities (states) that can occur on the site and the transitions between these communities. The ecological processes will be discussed in more detail in the plant community narratives following the diagram.

BMA – Brush Management (all methods)
 BMC – Brush Management (chemical)
 BMF – Brush Management (fire)
 BMM – Brush Management (mechanical)
 CSP – Chemical Seedbed Preparation
 CSLG – Continuous Season-long Grazing
 DR – Drainage
 CSG – Continuous Spring Grazing
 HB – Heavy Browse
 HCSLG – Heavy Continuous Season-long Grazing
 HI – Heavy Inundation
 LPG – Long-term Prescribed Grazing
 MT – Mechanical Treatment (chiseling, ripping, pitting)

NF – No Fire
 NS – Natural Succession
 NWC – Noxious Weed Control
 NWI – Noxious Weed Invasion
 NU – Nonuse
 P&C – Plow & Crop (including hay)
 PG – Prescribed Grazing
 RPT – Re-plant Trees
 RS – Re-seed
 SGD – Severe Ground Disturbance
 SHC – Severe Hoof Compaction
 WD – Wildlife Damage (Beaver)
 WF - Wildfire

**Plant Community Composition and Group Annual Production

other perennial forbs (native)		2FP	5	0 - 325	0 - 5
TREES/SHRUBS			6	325 - 975	5 - 15
Alpine laurel	Kalmia microphylla	KAMI	6	0 - 325	0 - 5
Currant	Ribes spp.	RIBES	6	0 - 325	0 - 5
Dogwood	Cornus spp.	CORNU	6	0 - 325	0 - 5
Rose	Rosa woodsii var. woodsii	ROWOW	6	0 - 325	0 - 5
Water birch	Betula occidentalis	BEOC2	6	0 - 325	0 - 5
Willows	Salix spp.	SALIX	6	0 - 325	0 - 5
other trees, shrubs, & half shrubs (native)		2SD/2SE/2TD/2TE	6	0 - 325	0 - 5

This list of plants and their relative proportions are based on near normal years. Fluctuations in species composition and relative production may change from year to year dependent upon precipitation or other climatic factors.

Plant Community Narratives

Following are the narratives for each of the described plant communities. These plant communities may not represent every possibility, but they probably are the most prevalent and repeatable plant communities. The plant composition tables shown above have been developed from the best available knowledge at the time of this revision. As more data is collected, some of these plant communities may be revised or removed, and new ones may be added. None of these plant communities should necessarily be thought of as “Desired Plant Communities”. According to the USDA NRCS National Range and Pasture Handbook, Desired Plant Communities (DPC’s) will be determined by the decision-makers and will meet minimum quality criteria established by the NRCS. The main purpose for including any description of a plant community here is to capture the current knowledge and experience at the time of this revision.

Sedge Plant Community (HCPC)

The interpretive plant community for this site is the Historic Climax Plant Community. This state evolved with grazing by large herbivores and is well suited for grazing by domestic livestock. Potential vegetation is estimated at 70% grasses or grass-like plants, 15% forbs, and 15% woody plants. The major grasses and grass-like plants include Nebraska sedge, tufted hairgrass, and northern reedgrass. Other grasses and grass-like plants that may occur on this site include alpine timothy, tall and American mannagrass, Baltic rush, bearded wheatgrass, big bluegrass, blue wildrye, inland sedge, nodding brome, bluejoint reedgrass, and other wetland sedge species. Willows are the major woody species. Other woody species may include woods rose, bog kalmia (alpine laurel), currant and water birch.

A typical plant composition for this state consists of Nebraska sedge 10-25%, tufted hairgrass 15-25%, northern reedgrass 10-25%, other grasses and grass-like plants 10-20%, perennial forbs 5-15%, and up to 15% woody plants. Ground cover, by ocular estimate, varies from 85-100%.

The total annual production (air-dry weight) of this state is about 6500 pounds per acre, but it can range from about 5500 lbs./acre in unfavorable years to about 7500 lbs./acre in above average years.

The following is the growth curve of this plant community expected during a normal year:

Growth curve number: WY0103

Growth curve name: 20+M, FREE WATER SITES

Growth curve description: WL, SB, SS FREE WATER SITES

JAN	FEB	MAR	APR	MAY	JUN	JUL	AUG	SEP	OCT	NOV	DEC
0	0	0	0	5	30	40	20	5	0	0	0

(Monthly percentages of total annual growth)

The state is well adapted to the Central Rocky Mountains climatic conditions. It is a critical state providing water and habitat for the surrounding area. The diversity in plant species provides a variety of habitats for wildlife. It is resistant to drought due to a dependable water supply. This is a sustainable plant community (site/soil stability, watershed function, and biologic integrity).

Transitions or pathways leading to other plant communities are as follows:

- Nonuse will convert this plant community to the *Willow/Sedge State*.
- Heavy Continuous Season-long Grazing will convert this plant community to the *Upland Sedge/Rush State*.

Willow/Sedge Plant Community

This plant community results from nonuse. Willows increase and often will inhibit herbaceous forage availability by creating a physical barrier to grazing animals. Nebraska sedge, water sedge, beaked sedge, and dogwood are often present in the protected understory.

The total annual production (air-dry weight) of this state is about 4500 pounds per acre, but it can range from about 3000 lbs./acre in unfavorable years to about 6000 lbs./acre in above average years.

The following is the growth curve of this plant community expected during a normal year:

Growth curve number: WY0103

Growth curve name: 20+M, FREE WATER SITES

Growth curve description: WL, SB, SS FREE WATER SITES

JAN	FEB	MAR	APR	MAY	JUN	JUL	AUG	SEP	OCT	NOV	DEC
0	0	0	0	5	30	40	20	5	0	0	0

(Monthly percentages of total annual growth)

The state is very stable and protected from excessive erosion. The biotic integrity of this plant community is intact. The watershed is functioning.

Transitional pathways leading to other plant communities are as follows:

- Brush Management followed by deferment for 1 to 2 years as part of a Prescribed Grazing plan will result in a plant community very similar to the *Historic Climax Plant Community (Sedge State)*. Care should be taken when planning brush management to consider wildlife habitat and critical winter ranges.
- Brush Management followed by Continuous Season-long Grazing will convert this plant community to the *Upland Sedge/Rush State*.

Upland Sedge/Rush Plant Community

This plant community evolved under heavy continuous season-long grazing by domestic livestock. Species such as Baltic rush, inland sedge, horsetail, elephanthead, and Rocky Mountain iris often dominate this state. Willows are greatly diminished and lack a diversity of age classes or are completely missing from the plant community.

The total annual production (air-dry weight) of this state is about 2500 pounds per acre, but it can range from about 1500 lbs./acre in unfavorable years to about 3500 lbs./acre in above average years.

The following is the growth curve of this plant community expected during a normal year:

Growth curve number: WY0103

Growth curve name: 20+M, FREE WATER SITES

Growth curve description: WL, SB, SS FREE WATER SITES

JAN	FEB	MAR	APR	MAY	JUN	JUL	AUG	SEP	OCT	NOV	DEC
0	0	0	0	5	30	40	20	5	0	0	0

(Monthly percentages of total annual growth)

The state is vulnerable to downcutting and excessive erosion. The biotic integrity of this plant community is at risk due to the replacement of deep rooted wetland species with shallow rooted grasses and forbs. The watershed is at risk from downcutting activity.

Transitional pathways leading to other plant communities are as follows:

It is not often practicable or economically feasible to convert this plant community.

Ecological Site Interpretations

Animal Community – Wildlife Interpretations

Sedge Plant Community (HCPC): This plant community is very important for most wildlife in the area. Over 80% of all wildlife use this site to fulfill some part of their habitat needs. It provides forage and thermal and hiding cover for mule deer, elk, and moose. It provides nesting habitat for shorebirds, songbirds, and waterfowl as well as ground nesting birds such as harriers. Dense ground cover provides escape cover, forage, and breeding areas for small mammals which draw predators such as raptors, red fox and coyote. Other birds that would frequent this plant community include red-wing blackbirds, sandhill cranes, western meadowlarks, neo-tropical migrants, and golden eagles.

Willow/Sedge Plant Community: This plant community is beneficial for the same wildlife that would use the Historic Climax Plant Community. However, dominance of woody species may improve thermal and hiding cover for all species, especially structural diversity needed for neo-tropical migrants, as well as provide more foraging areas for moose.

Upland Sedge/Rush Plant Community: This plant community may be beneficial for some of the same wildlife that would use the Historic Climax Plant Community. However, the woody component is typically less productive and unable to support large browsers such as moose. As woody plants decrease, structural diversity is lost for neo-tropical migrants, cover decreased for deer and elk, and nesting for shrub-nesting birds is impacted.

Animal Preferences (Quarterly - 1,2,3,4) for common plants in MLRA 43B, 20+M

N = not used; U = undesirable; D = desirable; P = preferred; T = toxic

- (a) Toxic in large amounts.
- (b) Poisonous in spring before flowering.
- (c) May be poisonous after seedpods mature.
- (d) Leaves are poisonous to sheep and cattle.
- (e) Young shoots are poisonous.

Animal Community – Grazing Interpretations

The following table lists suggested stocking rates for cattle under continuous season-long grazing under normal growing conditions. These are conservative estimates that should be used only as guidelines in the initial stages of the conservation planning process. Often, the current plant composition does not entirely match any particular plant community (as described in this ecological site description). Because of this, a field visit is recommended, in all cases, to document plant composition and production. More precise carrying capacity estimates should eventually be calculated using this information along with animal preference data, particularly when grazers other than cattle are involved. Under more intensive grazing management, improved harvest efficiencies can result in an increased carrying capacity. If distribution problems occur, stocking rates must be reduced to maintain plant health and vigor.

Plant Community	Production (lb./ac)	Carrying Capacity* (AUM/ac)
Sedge (HCPC)	5500-7500	2.0
Willow/Sedge	3000-6000	1.4
Upland Sedge/Rush	1500-3500	0.8

* - Continuous, season-long grazing by cattle under average growing conditions.

Grazing by domestic livestock is one of the major income-producing industries in the area. Rangeland in this area may provide yearlong forage for cattle, sheep, or horses. During the dormant period, the forage for livestock use needs to be supplemented with protein because the quality does not meet minimum livestock requirements.

Hydrology Functions

Climate is the principal factor limiting forage production on this site. This site is dominated by soils in hydrologic group D. Infiltration rate is very slow and runoff potential high for the soils of this site due to a high water table and saturated soil conditions. However, high forage production on this site diminishes runoff potential as long as site is managed for maintaining adequate residual vegetation. (Refer to Part 630, NRCS National Engineering Handbook for detailed hydraulic information).

Rills and gullies should not typically be present. Water flow patterns may be present if associated with a perennial flowing stream. Litter typically falls in place, and signs of movement are not common unless associated with a perennial flowing stream. Chemical and physical crusts are rare to non-existent.

Recreational Uses

This site provides a variety of hunting and fishing opportunities as well providing popular camping areas for recreationists when not saturated. Waterfowl hunting opportunities exist when associated with open water. The wide variety of plants which bloom from spring until fall have esthetic values that appeal to visitors.

Wood Products

No appreciable wood products are present on the site.

Supporting Information

Associated Sites

Subirrigated R043BY174WY

Similar Sites

R043BY278WY – Wetland (WL) 15-19W has lower production.
R043BY174WY – Subirrigated (Sb) 20+M has a lower water table and more shrubs.

Inventory Data References (narrative)

Information presented here has been derived from NRCS clipping data and other inventory data. Field observations from range trained personnel were also used. Those involved in developing this site include: Bill Christensen, Range Management Specialist, NRCS; Karen Clause, Range Management Specialist, NRCS; and Everet Bainter, Range Management Specialist, NRCS. Other sources used as references include: USDA NRCS Water and Climate Center, USDA NRCS National Range and Pasture Handbook, and USDA NRCS Soil Surveys from various counties.
