Common NRCS Practices Related to Pest Management on Organic Farms

The attached document, *Common NRCS Practices Related to Pest Management on Organic Farms*, was developed to outline various NRCS conservation practices that can be used to support pest management activities in organic systems. The primary role of NRCS related to pest management is in assisting clients with mitigating any resource concerns that may be created by their management activities. However, various practices as they are described here can be used in the broader context of providing benefit for integrated pest management (IPM).

The guide was authored by Sarah Brown (Oregon Tilth) and Giulio Ferruzzi (Natural Resources Conservation Service).
