

**NATURAL RESOURCES CONSERVATION SERVICE
CONSERVATION PRACTICE STANDARD
CONNECTICUT**

FEED MANAGEMENT

(Animal Units (AUs) Affected)

CODE 592

DEFINITION

Manipulating and controlling the quantity and quality of available nutrients, feedstuffs, or additives fed to livestock and poultry.

PURPOSE

- Improve feeding efficiency in a manner that facilitates and contributes to the conservation of natural resources.
- Reduce the quantity of nitrogen, phosphorus, sulfur, salts, and other nutrients excreted in the manure.
- Reduce the quantity and viability of pathogens in manure.
- Reduce odor, particulate matter, and greenhouse gas (GHG) emissions production from animal feeding operations.

CONDITIONS WHERE PRACTICE APPLIES

This practice applies to operations that have an approved Comprehensive Nutrient Management Plan (CNMP) with Feed Management as a component. These include:

Livestock and poultry operations with a whole farm nutrient imbalance, with more nutrients imported to the farm than are exported and/or utilized by cropping programs.

Livestock and poultry operations that have a significant accumulation of nutrients in the soil.

Livestock and poultry operations that land apply manure and do not have a land base large enough to allow nutrients to be applied at rates recommended by soil test and utilized by crops in the rotation.

Livestock and poultry operations seeking to improve nutrient use efficiencies.

Livestock and poultry operations seeking to reduce manure pathogens.

Livestock and poultry operations seeking to reduce odors and or GHGs from their manure.

The CNMP shall also include provisions for implementing Nutrient Management in accordance with current Connecticut NRCS Conservation Practice Standards 590, Nutrient Management and 633, Waste Utilization

CRITERIA

General Criteria Applicable to All Purposes

Sufficient nutrients shall be supplied to maintain the health, growth, production, performance and reproduction of livestock and poultry.

The diets for specific species of animals shall be developed in accordance with recommendations from one of the following:

- The most current recommendations of the National Research Council (NRC).
- Recommendations of the University of Connecticut (UConn).
- Science based standards developed by the professional nutritionists of livestock and poultry production companies, feed companies, and/or feed suppliers.

Laboratory analysis shall be done on the formulated diet, or on the feed ingredients used to formulate the diet, to determine its nutrient content.

Feed analyses shall be conducted by laboratories whose tests are accepted by the University of Connecticut. Data from analyzed feed ingredients and/or appropriate historic feed analysis information for the operation will be used for

adjustments of ration formulation.

Diets and feed management strategies shall be developed by professional animal scientists, independent professional nutritionists or other comparably qualified individuals. When required by state policy or regulation, animal nutritionists shall be certified through a certification program recognized by the University of Connecticut.

Diets shall be formulated to provide the quantities and correct relative ratios of available nutrients required by the animal species to meet the goals for which the plan is being developed.

Adjustments to nutrient levels shall be provided to meet specific genetic potential, environmental demands, and/or requirements to insure health, well-being and productivity.

One or more of the following feed management practices and/or diet manipulation technologies shall be used to reduce N, P, other excreted nutrients, pathogens, odors, and/or GHGs, while maintaining the health, well-being and productivity of the animal.

- Formulating diets closer to animal requirements.
- Reducing crude or total protein and supplementing with amino acids (non-ruminants).
- Manipulating the crude protein and energy (carbohydrate and fat) content of the diet to enhance the availability of amino acids (ruminants).
- Using highly digestible feeds and forages, as appropriate, in the diet.
- Using phytase and reducing the supplemental phosphorus content of the diet (non-ruminants)
- Reducing the phosphorus content of the diet of ruminants when P is being overfed.
- Using selected scientifically supported, enzymes or other products to enhance feed digestibility or feed use efficiency.
- Using scientifically supported and environmentally benign growth promotants and additives as allowed by law.
- Implementing phase feeding.

- Implementing split-sex feeding.
- Using other feed processing, management, or diet manipulation technologies that have demonstrated the ability to reduce manure nutrient content, pathogens, odors, or GHGs.
- When livestock are obtaining their diet by grazing pastures as well as mechanically harvested and processed feeds, pasture forages will be tested for nutrient content and accounted for in the feed ration and balance of nutrients. All feeds, including grazed pasture will be included in an analysis for meeting the livestock's nutritional requirements and avoiding excess nutrients being fed. Forage tests will meet the Land Grant University's acceptance and certification process.

CONSIDERATIONS

Feed management can improve net farm income by feeding nutrients more efficiently.

Consider nutrient requirements for production based upon stage of growth, intended purpose of the animal and the type of production (e.g., meat, milk, eggs) involved.

Use management practices described in the NRCS Nutrient Management (Feed Management) Technical Note for the specific animal species³.

Consider different feed ingredients (e.g. by-products) and their potential impacts on the nutrient content of excreted manure.

Consider the potential impact of feed management on the volume of manure excreted and on manure storage requirements.

Consider the impact of feed management practices and diet manipulation on manure odors, pathogens, GHGs, dust, animal health and well-being even if one or more of these are not included in the client's objectives.

Consider maximizing the use of concentrates and forages grown on the farm to minimize the quantity of nutrients imported to the farm, and to maximize the recycling of nutrients on the farm.

Analyze freshly excreted manure to determine manure nutrient content and to estimate the impact of the feeding strategy.

PLANS AND SPECIFICATIONS

Plans and specifications for feed management shall be in keeping with the requirements of this standard. They shall describe the specific feed management practices and/or technologies that are planned for the operation.

The following components shall be included in the feed management plan:

- The type of technology, or technologies, and/or feeding practices that will be used on the operation, and their intended outcome.
- Feed analyses and ration formulation information prior to and after implementation of feed management on the operation.
- Protocols for sampling and preserving feed ingredients, manure, and water, as applicable, prior to sending for analysis.
- The estimated, or measured, nutrient content of the manure prior to the implementation of feed management on the operation.
- The measured impact that feed management will have on manure nutrient content.
- The expected impact on pathogen content, odor, and GHG reduction of manure.
- Guidance for how often the feed management plan shall be reviewed and potentially revised.
- The quantities and sources of nitrogen and phosphorus that will be fed.
- Identification of the qualified feed management specialist who developed the plan.
- Feed rations should be formulated and mixed based on weight not by volume.
- Baseline data parameters of productivity and/or animal health should be developed prior to the feed change and monitored/documented after the change to ensure no adverse effects result from the change.
- Analysis of forages, concentrates and mixed rations should be by an approved

lab using wet chemistry. NIR analysis will not be accepted.

OPERATION AND MAINTENANCE

The producer/client is responsible for the operation and maintenance of the feed management plan. Operation and maintenance activities address the following:

- Periodic plan review to determine if adjustments or modifications are needed.
- Routine feed analysis to document the rates at which nitrogen and phosphorus were actually fed. When actual rates fed differ from or exceed the planned rates, records will indicate the reasons for the differences.
- Maintain records to document plan implementation. As applicable, records include:
 - Records of feed analysis and ration formulation, including the record of ration formulation used prior to implementing the feeding strategy. These records shall demonstrate to NRCS that rations were formulated and mixed based on weights.
 - ◆ Records estimating the impact the feeding strategy is having on reducing manure nutrient content.
 - ◆ Manure analysis that was done after the feeding strategy was implemented to determine manure nutrient content.
 - ◆ Dates of review and person performing the review, and any recommendations that resulted from the review.

Records of plan implementation shall be maintained for five years, or for a period longer than five years if required by other Federal, state, or local ordinances, program, or contract requirements.
