

## FORAGE SUITABILITY GROUP WET

**FSG No.:** G055AY900ND

**Major Land Resource Area** - Northern Black Glaciated Plains

### Physiographic Features

The soils in this group are found in swales and depressions on flood plains, glacial lake and outwash plains, upland depressions and swales, and gently sloping side slopes of streams.

	<u>Minimum</u>	<u>Maximum</u>
<b>Elevation (feet):</b>	980	2300
<b>Slope (percent):</b>	0	3
<b>Flooding:</b>		
<b>Frequency:</b>	None	Frequent
<b>Duration:</b>	None	Long
<b>Ponding:</b>		
<b>Depth (inches):</b>	0	6
<b>Frequency:</b>	None	Frequent
<b>Duration:</b>	None	Long
<b>Runoff Class:</b>	Negligible	Low

### Climatic Features

This group occurs in a mid-continental climate characterized by wide seasonal temperature and precipitation fluctuations and extremes.

Annual precipitation varies widely from year to year in MLRA 55A. Average annual precipitation for all climate stations listed below is about 17.5 inches. About 79 percent of that occurs during the months of April through September. On average there are about 27 days with greater than .1 inches of precipitation during the same time frame.

Average annual snowfall ranges from 26 inches at Hannah, ND to 44 inches at Belcourt Keya, ND. Days with snow cover at depths greater than 1 inch range from 64 days at Velva, ND to 123 days at Hannah, ND.

Average July temperatures are about 68 degrees F., and average January temperatures are about 3 degrees F. Recorded temperature extremes in the MLRA during the years 1961 to 1990 are a low of -39 at both Petersburg and Oakes in ND, and a high of 108 recorded at both Granville and Velva. The MLRA lies in USDA Plant Hardiness Zones 3A and 3b.

The climate data listed in the tables below represent high and low ranges and averages for the climate stations and dates listed. For additional climate data access the National Water and Climate Center at <http://www.wcc.nrcs.usda.gov>.

**Soil Interpretations**

This group consists of poorly drained, coarse to fine textured soils. They are ponded during a portion of the year or have a watertable that comes to or near the surface during part of the growing season.

<b>Drainage Class:</b>	Poorly drained	To	Poorly drained
<b>Permeability Class:</b> (0 - 40 inches)	Slow	To	Moderately rapid
<b>Frost Action Class:</b>	Moderate	To	High

	<b><u>Minimum</u></b>	<b><u>Maximum</u></b>
<b>Depth:</b>	72	
<b>Surface Fragments &gt;3" (% Cover):</b>	0	3
<b>Organic Matter (percent):</b> (surface layer)	2.0	10.0
<b>Electrical Conductivity (mmhos/cm):</b> (0 - 24 inches)	0	4
<b>Sodium Absorption Ratio:</b> (0 - 12 inches)	0	5

	<u>Minimum</u>	<u>Maximum</u>
<b>Soil Reaction (1:1) Water (pH):</b> (0 - 12 inches)	5.6	8.4
<b>Available Water Capacity (inches):</b> (0 - 60 inches)	3	12
<b>Calcium Carbonate Equivalent (percent):</b> (0 - 12 inches)	0	28

### Adapted Species List

The following forage species are considered adapted to grow on the soils in this group. Additional information concerning plant characteristics of a number of the listed species as well as individual cultivars of many those species can be accessed at <http://plants.usda.gov>

<b>Cool Season Grasses</b>	<u>Symbol</u>	
Creeping foxtail	ALAR	G
Reed canarygrass	PHAR3	G
Tall wheatgrass	THPO7	F
Timothy	PHAL2	F
Western wheatgrass	PASM	G

<b>Warm Season Grasses</b>	<u>Symbol</u>	
Prairie cordgrass	SPPE	G
Switchgrass	PAVIV	G

<b>Legumes</b>		
Alsike clover	TRHY	G
Strawberry clover	ERFR2	F
Sweet clover	MELIL	F

G - Good adaptation for forage production on this group of soils in this MLRA

F - Fair adaptation but will not produce at its highest potential

### Production Estimates

Production estimates listed here should only be used for making general management recommendations. On site production information should always be used for making detailed planning and management recommendations.

The high forage production estimates listed below are based on dense, vigorous stands of climatically adapted, superior performing cultivars. They are properly fertilized for high yields, and pest infestations are kept below economic thresholds. Mechanical harvests are managed to maintain stand life by cutting at appropriate stages of maturity and harvest intervals. If grazed, optimum beginning and ending grazing heights are adhered to. Adequate time is allowed for plant recovery before entering winter dormancy under both uses.

The production estimates listed below represent total annual above ground plant production on an air-dry-matter basis. Estimates of hay and grazing yields can be calculated from these numbers by multiplying them by a harvest efficiency. A 70 percent harvest efficiency is commonly used when converting to hay yields. Pasture harvest efficiency is highly dependent on the grazing management system applied, ranging from 25 to 50 percent.

Forage Crop	<u>Dryland</u>	
	Management Intensity	
	<u>Low</u> (lbs/ac)	<u>High</u> (lbs/ac)
Creeping foxtail	4000	8200
Reed Canarygrass	4500	9400

**Forage Growth Curves**

Growth curves estimate the seasonal distribution of growth of the various forage crops. They indicate when the forages may be available for grazing or mechanical harvest.

**Growth Curve Number:** ND0002  
**Growth Curve Name:** Cool season grass  
**Growth Curve Description:** Cool season grass

0	0	0	0	10	40	35	15	0	0	0	0

**Soil Limitations**

The primary limitation for these soils is wetness, which may severely limit species selection, delay planting and harvesting of forage crops or result in wheel track ruts or livestock poach marks from hooves. The result can be soil compaction, injury to plants, poor soil aeration affecting plant growth, and problems with movement of livestock and machinery. Many of the soils in this group are subject to flooding or ponding that will adversely impact forage production when it occurs during the growing season. The time period plants are under water and the soil temperature while it occurs are important for the survival of forage crops. Dormant forages are little affected by inundation unless the water turns to ice.

**Management Interpretations**

When establishing new stands or renovating older stands select species that are tolerant of poorly and very poorly drained soils. Excluding livestock and machinery during extended periods of soil wetness will reduce

Pasture and hayland can include considerations for wildlife. Delaying grazing on portions of the pasture or rotating pastures will allow nest initiation of grassland nesting birds or species of concern. Nest initiation of most grassland nesting birds occurs from April 15 to June 1. Delaying haying until after July 15 allows for most species to fledge their young. Consider planting species with later maturity to allow for harvesting after nests have fledged. Avoid mowing around the field. Mow back and forth or from the inside to the outside of the field. Consider using flushing bars on swathers and mowers.
