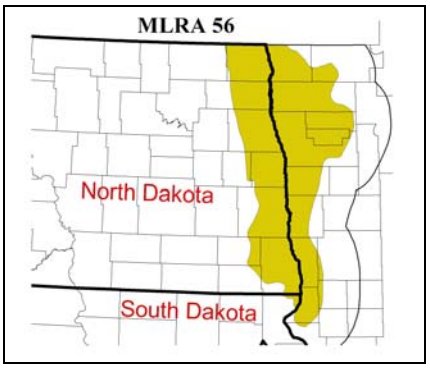
FORAGE SUITABILITY GROUP
LOAM

FSG No.: **G056XY100ND**
Major Land Resource Area: 056X - Red River Valley of the North



Physiographic Features

The soils in this group are located on upland positions of till plains and moraines. They are also found on glacial lake and delta plains and glacial stream terraces.

	Minimum	Maximum
Elevation (feet):	660	1000
Slope (percent):	0	15
Flooding:		
Frequency:	None	Occasional
Duration:	None	Brief
Ponding:		
Depth (inches):		
Frequency:	None	None
Duration:	None	None
Runoff Class:	Negligible	High

Climatic Features

This group occurs in a mid-continental climate characterized by wide seasonal temperature and precipitation fluctuations and extremes.

Annual precipitation varies widely from year to year in MLRA 56. Average annual precipitation for all climate stations listed below is about 20 inches. About 70 percent of that occurs during the months of April through September. On average there are about 27 days with greater than .1 inches of precipitation during the same time period. Precipitation is less than needed for optimum forage production and is the single largest factor limiting production from this group on non-irrigated lands.

Average annual snowfall ranges from 21 inches at Grafton, ND to 47 inches at Fargo, ND. Snow cover at depths greater than 1 inch range from 33 days at Grafton, ND to 124 days at Cavalier, ND.

Average July temperatures are about 70 degrees F., and average January temperatures are about 6 degrees F. Recorded temperature extremes in the MLRA during the years 1971 to 2000 are a low of -41 at McLeod, and a high of 107 recorded at both Colgate and Wapheton. The MLRA lies in USDA Plant Hardiness Zones 3b and 4a.

At Fargo, ND the average annual wind speed is about 12 MPH. The highest wind speeds occur during early spring and the lowest occur during the summer. It is cloudy about 165 days a year. Average morning relative humidity in June is about 82 percent and average afternoon humidity is about 59 percent.

The climate data listed in the tables below represent high and low ranges and averages for the climate stations and dates listed. For additional climate data access the National Water and Climate Center at http://www.wcc.nrcs.usda.gov.

	From	To
Freeze-free period (28 deg)(days): **(9 years in 10 at least)**	126	141

Soil Interpretations

This group consists of well and moderately well drained, moderately coarse to moderately fine textured soils formed mostly in glacial till or alluvium. Available water capacity is high and permeability is moderately slow to moderate.

Drainage Class:	Moderately well drained	To	Well drained
Permeability Class: (0 - 40 inches)	Moderately slow	To	Moderately rapid
Frost Action Class:	Moderate	To	High

	Minimum	**Maximum**
Depth:	72	0
Surface Fragments >3" (% Cover):	0	3
Organic Matter (percent): (surface layer)	2.0	8.0
Electrical Conductivity (mmhos/cm): (0 - 24 inches)	0	4
Sodium Absorption Ratio: (0 - 12 inches)	0	0
Soil Reaction (1:1) Water (pH): (0 - 12 inches)	6.1	8.4

	Minimum	Maximum
Available Water Capacity (inches): (0 - 60 inches)	8	12
Calcium Carbonate Equivalent (percent): (0 - 12 inches)	0	8

Adapted Species List

The following forage species are considered adapted to grow on the soils in this group. Additional information concerning plant characteristics of a number of the listed species as well as individual cultivars of many of those species can be accessed on the web at http://plants.usda.gov.

Cool Season Grasses	Symbol	
Altai wildrye	LEAN3	F
Bluebunch/Quackgrass Hybrid		G
Canada wildrye	ELCA4	F
Crested wheatgrass	AGCR	G
Dahurian wildrye	ELDA3	G
Green needlegrass	NAVI4	G
Intermediate wheatgrass	THIN6	G
Meadow bromegrass	BRBI2	G
Pubescent wheatgrass	THIN6	G
Russian wildrye	PSJU3	G
Slender wheatgrass	ELTR7	G
Smooth bromegrass	BRINI2	G
Tall wheatgrass	THPO7	G
Western wheatgrass	PASM	G

Warm Season Grasses	Symbol	
Big bluestem	ANGE	G
Blue grama	BOGR2	G
Indiangrass	SONU2	G
Little bluestem	SCSC	G
Prairie sandreed	CALO	F
Sand bluestem	ANHA	F
Sideoats grama	BOCU	G
Switchgrass	PAVIV	G

Legumes	Symbol	
Alfalfa	MESA	G
American vetch	VIAM	G
Birdsfoot trefoil	LOCO6	F
Canada milkvetch	ASCAC6	G
Cicer milkvetch	ASCI4	G
Hairy vetch	VIVI	G
Purple prairieclover	DAPUP	G
Red clover	TRPR2	G
Sainfoin	ONVI	F
Sweet clover	MELIL	G
White clover	TRRE3	G
White prairieclover	DACAC	G

G - Good adaptation for forage production on this group of soils in this MLRA
F - Fair adaptation but will not produce at its highest potential

Production Estimates

Production estimates listed here should only be used for making general management recommendations. On site production information should always be used for making detailed planning and management recommendations.

The high forage production estimates listed below are based on dense, vigorous stands of climatically adapted, superior performing cultivars. They are properly fertilized for high yields, and pest infestations are kept below economic thresholds. Mechanical harvests are managed to maintain stand life by cutting at appropriate stages of maturity and harvest intervals. If grazed, optimum beginning and ending grazing heights are adhered to. Adequate time is allowed for plant recovery before entering winter dormancy under both uses.

The production estimates listed below represent total annual above ground plant production on an air-dry-matter basis. Estimates of hay and grazing yields can be calculated from these numbers by multiplying them by a harvest efficiency. A 70 percent harvest efficiency is commonly used when converting to hay yields. Pasture harvest efficiency is highly dependent on the grazing management system applied, ranging from 25 to 50percent.

Forage Crop	Management Intensity	
	Low (lbs/ac)	High (lbs/ac)
Alfalfa	4400	10300
Alfalfa/Intermediate wheatgrass	4000	8800
Alfalfa/smooth bromegrass	4000	8800
Big bluestem	3300	7500
Crested wheatgrass	3000	6800
Green needlegrass	2300	5200
Intermediate wheatgrass	3200	7200
Smooth bromegrass	3200	7200
Switchgrass	3500	8800
Western wheatgrass	2300	5200

Forage Growth Curves

Growth curves estimate the seasonal distribution of growth of the various forage crops. They indicate when the forages may be available for grazing or mechanical harvest.

Growth Curve Number: ND0001
Growth Curve Name: Alfalfa
Growth Curve Description: Alfalfa

Percent Production by Month

Soil Limitations

These soils have few limitations to the production of climatically adapted forage crops. On steeper slopes water erosion is a potential problem during establishment, when renovating stands, and in thin established stands. Livestock trail erosion is a potential problem in established stands.

Management Interpretations

Including sod forming grass species in stands, especially on steeper slopes, will reduce the potential for sheet and rill erosion. Incorporate erosion control practices during the establishment period. Properly locating facilitating practices such as fences, lanes, and water developments can help control livestock movement, reduce trailing perpendicular to steeper slopes, and evenly distribute grazing pressure.

Pasture and hayland can include considerations for wildlife. Delaying grazing on portions of the pasture or rotating pastures will allow nest initiation of grassland nesting birds or species of concern. Nest initiation of most grassland nesting birds occurs from April 15 to June 1. Delaying haying until after July 15 allows for most species to fledge their young. Consider planting species with later maturity to allow for harvesting after nests have fledged. Avoid mowing around the field. Mow back and forth or from the inside to the outside of the field. Consider using flushing bars on swathers and mowers.

FSG Documentation

Similar FSGs:

FSG ID	FSG Narrative
G056XY120ND	Droughty Loam soils are shallower or coarser textured resulting in lower available water capacity and lower production potential.
G056XY500ND	Overflow soils receive additional moisture due to a favorable landscape position resulting in a higher production potential.
