

FORAGE SUITABILITY GROUP VERY DROUGHTY LOAM

FSG No.: G056XY130ND

Major Land Resource Area: 056X - Red River Valley of the North

Physiographic Features

The soils in this group are found on level to moderately sloping positions on glacial outwash plains, deltas, eskers, kames, terraces, beach ridges, and moranes. They are also found on till plains and stream valleys.

	<u>Minimum</u>	<u>Maximum</u>
Elevation (feet):	660	1000
Slope (percent):	0	9
Flooding:		
Frequency:	None	None
Duration:	None	None
Ponding:		
Depth (inches):		
Frequency:	None	None
Duration:	None	None
Runoff Class:	Negligible	Medium

Climatic Features

This group occurs in a mid-continental climate characterized by wide seasonal temperature and precipitation fluctuations and extremes.

Annual precipitation varies widely from year to year in MLRA 56. Average annual precipitation for all climate stations listed below is about 20 inches. About 70 percent of that occurs during the months of April through September. On average there are about 27 days with greater than .1 inches of precipitation during the same time period.

Average annual snowfall ranges from 21 inches at Grafton, ND to 47 inches at Fargo, ND. Snow cover at depths greater than 1 inch range from 33 days at Grafton, ND to 124 days at Cavalier, ND.

Average July temperatures are about 70 degrees F., and average January temperatures are about 6 degrees F. Recorded temperature extremes in the MLRA during the years 1971 to 2000 are a low of -41 at McLeod, and a high of 107 recorded at both Colgate and Wapheton. The MLRA lies in USDA Plant Hardiness Zones 3b and 4a.

At Fargo, ND the average annual wind speed is about 12 MPH. The highest wind speeds occur during early spring and the lowest occur during the summer. It is cloudy about 165 days a year. Average morning relative humidity in June is about 82 percent and average afternoon humidity is about 59 percent.

The climate data listed in the tables below represent high and low ranges and averages for the climate stations and dates listed. For additional climate data access the National Water and Climate Center at <http://www.wcc.nrcs.usda.gov>.

	From	To
Freeze-free period (28 deg)(days): (9 years in 10 at least)	126	141

Soil Interpretations

This group consists of well to excessively drained, medium to moderately coarse textured soils that are moderately deep to shallow over sand and gravel.

Drainage Class:	Well drained	To	Somewhat excessively drained
Permeability Class: (0 - 40 inches)	Moderate	To	Moderately rapid
Frost Action Class:	Low	To	Low

	<u>Minimum</u>	<u>Maximum</u>
Depth:	72	
Surface Fragments >3" (% Cover):	0	3
Organic Matter (percent): (surface layer)	1.0	6.0
Electrical Conductivity (mmhos/cm): (0 - 24 inches)	0	2
Sodium Absorption Ratio: (0 - 12 inches)	0	0
Soil Reaction (1:1) Water (pH): (0 - 12 inches)	6.6	8.4

	<u>Minimum</u>	<u>Maximum</u>
Available Water Capacity (inches): (0 - 60 inches)	3	5
Calcium Carbonate Equivalent (percent): (0 - 12 inches)	0	13

Adapted Species List

The following forage species are considered adapted to grow on the soils in this group. Additional information concerning plant characteristics of a number of the listed species as well as individual cultivars of many of those species can be accessed on the web at <http://plants.usda.gov>.

Cool Season Grasses	<u>Symbol</u>		Warm Season Grasses	<u>Symbol</u>	
Bluebunch/Quackgrass Hybrid		F	Blue grama	BOGR2	F
Crested wheatgrass	AGCR	F	Little bluestem	SCSC	F
Dahurian wildrye	ELDA3	F	Prairie sandreed	CALO	F
Green needlegrass	NAVI4	F	Sand bluestem	ANHA	F
Intermediate wheatgrass	THIN6	F	Sideoats grama	BOCU	F
Pubescent wheatgrass	THIN6	F			
Russian wildrye	PSJU3	F	Legumes	<u>Symbol</u>	
Slender wheatgrass	ELTR7	F	American vetch	VIAM	F
Smooth brome grass	BRINI2	F	Purple prairieclover	DAPUP	G
Western wheatgrass	PASM	F	Sweet clover	MELIL	F
			White prairieclover	DACAC	G

G - Good adaptation for forage production on this group of soils in this MLRA

F - Fair adaptation but will not produce at its highest potential

Production Estimates

Production estimates listed here should only be used for making general management recommendations. On site production information should always be used for making detailed planning and management recommendations.

The high forage production estimates listed below are based on dense, vigorous stands of climatically adapted, superior performing cultivars. They are properly fertilized for high yields, and pest infestations are kept below economic thresholds. Mechanical harvests are managed to maintain stand life by cutting at appropriate stages of maturity and harvest intervals. If grazed, optimum beginning and ending grazing heights are adhered to. Adequate time is allowed for plant recovery before entering winter dormancy under both uses.

The production estimates listed below represent total annual above ground plant production on an air-dry-matter basis. Estimates of hay and grazing yields can be calculated from these numbers by multiplying them by a harvest efficiency. A 70 percent harvest efficiency is commonly used when converting to hay yields. Pasture harvest efficiency is highly dependent on the grazing management system applied, ranging from 25 to 50 percent.

Forage Crop	<u>Dryland</u>	
	Management Intensity	
	<u>Low</u> (lbs/ac)	<u>High</u> (lbs/ac)
Crested wheatgrass	1500	3100
Pubescent wheatgrass	1800	3100
Western wheatgrass	1200	2100

Forage Growth Curves

Growth curves estimate the seasonal distribution of growth of the various forage crops. They indicate when the forages may be available for grazing or mechanical harvest.

Soil Limitations

The primary limitation for these soils is their low available water capacity due to moderate depth to bedrock or sand and gravel. This results in limited species selection and production potential. On steeper slopes water erosion is a potential problem during establishment, when renovating stands, and in thin established stands. Livestock trail erosion is a potential problem on established stands. Also, wind erosion is a potential problem during stand establishment on moderately coarse textured soils.

Management Interpretations

The impact on yields of the low available water capacity of these soils can be reduced by selecting forage species that are highly tolerant of periods of drought and inadequate soil moisture. Including sod forming grass species in stands, especially on steeper slopes, will reduce the potential for sheet and rill erosion. Incorporate both wind and water erosion control practices during the establishment period. Properly locating facilitating practices such as fences, lanes, and water developments can help control livestock movement, reduce trailing perpendicular to steeper slopes, and evenly distribute grazing pressure.

Pasture and hayland can include considerations for wildlife. Delaying grazing on portions of the pasture or rotating pastures will allow nest initiation of grassland nesting birds or species of concern. Nest initiation of most grassland nesting birds occurs from April 15 to June 1. Delaying haying until after July 15 allows for most species to fledge their young. Consider planting species with later maturity to allow for harvesting after nests have fledged. Avoid mowing around the field. Mow back and forth or from the inside to the outside of the field. Consider using flushing bars on swathers and mowers.

FSG Narrative

Shallow soils are shallower to sand and gravel and have lower production potential.

G056XY120ND

Droughty Loam soils have higher available water capacity and greater production potential.
