

## FORAGE SUITABILITY GROUP (FSG) CLAYPAN

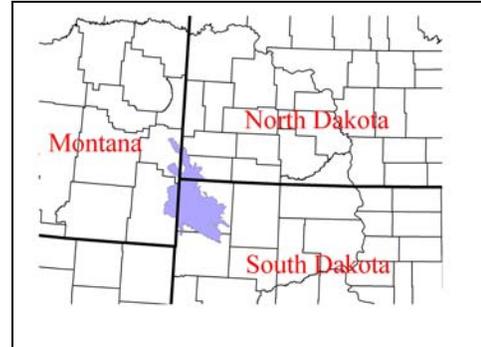

**FSG No.:** G058DY800SD

**Major Land Resource Area (MLRA):** 058D - Northern Rolling High Plains, Eastern Part

### Physiographic Features

The soils in the Claypan group are found on alluvial fans, terraces, drainageways, till plains, and sedimentary plains.

	<u>Minimum</u>	<u>Maximum</u>
<b>Elevation (feet):</b>	2300	3300
<b>Slope (percent):</b>	0	9
<b>Flooding:</b>		
<b>Frequency:</b>	None	Rare
<b>Duration:</b>	None	Very Brief
<b>Ponding:</b>		
<b>Depth (inches):</b>		
<b>Frequency:</b>	None	None
<b>Duration:</b>	None	None
<b>Runoff Class:</b>	Medium	Very high

### Climatic Features

This group occurs in a mid-continental climate characterized by wide seasonal temperature and precipitation fluctuations and extremes.

Average annual precipitation for all climate stations in MLRA 58D listed below is about 16 inches. Although average annual precipitation is low, about 80 percent occurs during the growing season months of April through September. On average, there are about 25 days with greater than .1 inches of precipitation during that same time period.

Average annual snowfall ranges from 25 inches at Amidon, North Dakota (ND), to 46 inches at Redig, South Dakota (SD). Days with insulating snow cover at depths greater than 1 inch range from 22 at Ludlow, SD, to 81 at Bowman, ND.

Average July temperatures across the MLRA are about 70°F and average January temperatures are about 15°F. Recorded temperature extremes in the MLRA during the years 1961 to 1990 are a low of -46° recorded at Camp Crook, SD, and a high of 115 recorded at Ludlow, SD. The MLRA lies mostly in USDA Plant Hardiness Zones 4a with a small area of colder 3b on the western edge of Harding County in South Dakota.

The climate data listed in the tables below represent high and low ranges and averages for the climate stations and dates listed. For additional climate data access the National Water and Climate Center at <http://www.wcc.nrcs.usda.gov>.

	<b>From</b>	<b>To</b>
<b>Freeze-free period (28 deg)(days):</b> (9 years in 10 at least)	107	131
<b>Last Killing Freeze in Spring (28 deg):</b> (1 year in 10 later than)	May 25	May 15
<b>Last Frost in Spring (32 deg):</b> (1 year in 10 later than)	Jun 19	May 28
<b>First Frost in Fall (32 deg):</b> (1 year in 10 earlier than)	Aug 26	Sep 06

**Soil Interpretations**

This group consists mostly of well drained, moderately coarse to medium textured soils formed from alluvium and residuum. They have claypan subsoils with slow permeability. The underlying material and lower part of the subsoil typically have high amounts of soluble salts and are alkaline.

<b>Drainage Class:</b>	Somewhat poorly drained	To	Well drained
<b>Permeability Class:</b> (0 - 40 inches)	Slow	To	Very slow
<b>Frost Action Class:</b>	Low	To	Moderate

	<b><u>Minimum</u></b>	<b><u>Maximum</u></b>
<b>Depth:</b>	20	
<b>Surface Fragments &gt;3" (% Cover):</b>	0	3
<b>Organic Matter (percent):</b> (surface layer)	0.5	3.0
<b>Electrical Conductivity (mmhos/cm):</b> (0 - 24 inches)	0	15
<b>Sodium Absorption Ratio:</b> (0 - 12 inches)	0	20
<b>Soil Reaction (1:1) Water (pH):</b> (0 - 12 inches)	5.6	8.4
<b>Available Water Capacity (inches):</b> (0 - 60 inches)	4	9
<b>Calcium Carbonate Equivalent (percent):</b> (0 - 12 inches)	0	3

### Adapted Species List

The following forage species are considered adapted to grow on the soils in this group. Additional information concerning plant characteristics of a number of the listed species as well as individual cultivars of many of those species can be accessed on the web at <http://plants.usda.gov>.

<b>Cool Season Grasses</b>	<b><u>Symbol</u></b>	
Beardless wildrye	LETR5	F
Bluebunch/Quackgrass Hybrid		F
Crested wheatgrass	AGCR	F
Green needlegrass	NAVI4	F
Intermediate wheatgrass	THIN6	F
Bluebunch/Quackgrass Hybrid		F
Pubescent wheatgrass	THIN6	F
Russian wildrye	PSJU3	F
Slender wheatgrass	ELTR7	F
Smooth bromegrass	BRINI2	F
Tall wheatgrass	THPO7	G
Western wheatgrass	PASM	G
<b>Legumes</b>	<b><u>Symbol</u></b>	
Alfalfa	MESA	F

G - Good adaptation for forage production on this group of soils in this MLRA

F - Fair adaptation but will not produce at its highest potential

### Production Estimates

Production estimates listed here should only be used for making general management recommendations. Onsite production information should always be used for making detailed planning and management recommendations.

The high forage production estimates listed below are based on dense, vigorous stands of climatically adapted, superior performing cultivars. They are properly fertilized for high yields, and pest infestations are kept below economic thresholds. Mechanical harvests are managed to maintain stand life by cutting at appropriate stages of maturity and harvest intervals. If grazed, optimum beginning and ending grazing heights are adhered to. Adequate time is allowed for plant recovery before entering winter dormancy under both uses.

The production estimates listed below represent total annual above ground plant production on an air-dry-matter basis. Estimates of hay and grazing yields can be calculated from these numbers by multiplying them by a harvest efficiency. Seventy percent harvest efficiency is commonly used when converting to hay yields. Pasture harvest efficiency is highly dependent on the grazing management system applied, ranging from 25 to 50 percent.

<b>Forage Crop</b>	<b><u>Dryland</u></b>	
	<b>Management Intensity</b>	
	<b><u>Low</u></b> <b>(lbs/ac)</b>	<b><u>High</u></b> <b>(lbs/ac)</b>
Alfalfa	1800	3700
Alfalfa/Intermediate wheatgrass	1500	3000
Intermediate wheatgrass	1500	3000
Tall wheatgrass	1300	2900
Western wheatgrass	900	1920

### **Forage Growth Curves**

Growth curves estimate the seasonal distribution of growth of the various forage crops. They indicate when the forages may be available for grazing or mechanical harvest.

**Growth Curve Number:** ND0001  
**Growth Curve Name:** Alfalfa  
**Growth Curve Description:** Alfalfa

<b><u>Percent Production by Month</u></b>

### **Soil Limitations**

These soils have severe limitations to the production of climatically adapted forage species. The claypan and the soluble salts and sodicity in the subsoil produce an unfavorable rooting environment, limiting species selection and production potential.

### **Management Interpretations**

The impact on yields can be reduced by selecting forage species that are tolerant of salinity and sodicity and can root in dense, clayey subsoils.

Pasture and hayland can include considerations for wildlife. Delaying grazing on portions of the pasture or rotating pastures will allow nest initiation of grassland nesting birds or species of concern. Nest initiation of most grassland nesting birds occurs from April 15 to June 1. Delaying haying until after July 15 allows for most species to fledge their young. Consider planting species with later maturity to allow for harvesting after nests have fledged. Avoid mowing around the field. Mow back and forth or from the inside to the outside of the field. Consider using flushing bars on swathers and mowers.
