

### **SECTION 683.26 CONSUMPTIVE USE AND LIMITING FACTORS OF SELECTED CROPS**

It isn't possible to figure crop consumptive use curves for some crops because of the wide variance from season to season and the variance in management practices. In some cases, there isn't enough available research on consumptive use to formulate curves.

The following table has listed some of these crops with a peak daily rate and annual usage which was figured by the Blaney Criddle method. Other moisture related factors are also listed.

If more research is done on these crops and management practices become more uniform, consumptive use curves will be developed.
