

**SECTION 683.22 CONSUMPTIVE  
USE AND OTHER LIMITING  
FACTORS OF:****SORGHUM**

Total Growing Period	110 to 130 days
Maximum % of depletion allowable of AWC to optimize yields	55%
Critical growth period (lack of water will dramatically affect yields)	Flowering and early seed set
Period of water savings (lack of water won't change the yield dramatically)	Vegetative, late head and ripening period or all season long
Sign of serious moisture stress	Lead curl by 10:00 a.m.
Other considerations and constraints	When water supply is limited, it may be advantageous to spread water supply over a larger acreage.
