Natural Resources Conservation Service

Ecological Site Description

Site Type: Rangeland

Site Name: Saline Subirrigated

Site ID: R060AY036SD

Major Land Resource Area: 60A – Pierre Shale Plains

Physiographic Features

This site is nearly level to gently sloping and occurs on river valleys.

Landform: alluvial fan, flood plain, stream terrace **Aspect:** N/A

	Minimum	Maximum
Elevation (feet):	2500	4300
Slope (percent):	0	3
Water Table Depth (inches):	12	48
Flooding:		
Frequency:	Rare	Occasional
Duration:	Very brief	Brief
Ponding:		
Depth (inches):	None	None
Frequency:	None	None
Duration:	None	None
Runoff Class:	Low	Medium

Climatic Features

The climate in this MLRA is typical of the drier portions of the Northern Great Plains where sagebrush steppes to the west yield to grassland steppes to the east. Annual precipitation ranges from 13 to 18 inches per year, with most occurring during the growing season. Temperatures show a wide range between summer and winter and between daily maximums and minimums, due to the high elevation and dry air, which permits rapid incoming and outgoing radiation. Cold air masses from Canada in winter move rapidly from northwest to southeast and account for extreme minimum temperatures. Chinook winds may occur in winter and bring rapid rises in temperature. Extreme storms may occur during the winter, but most severely affect ranch operations during late winter and spring. The normal average annual temperature is about 46° F. January is the coldest month with average temperatures ranging from about 19° F (Moorcroft CAA, WY) to about 22° F (Belle Fourche, SD). July is the warmest month with temperatures averaging from about 70° F (Moorcroft CAA, WY) to about 72° F (Belle Fourche, SD). The range of normal average monthly temperatures between the coldest and warmest months is about 51° F. Hourly winds are estimated to average about 11 miles per hour annually, ranging from about 13 miles per hour during the spring to about 10 miles per hour during the summer. Daytime winds are generally stronger than nighttime and occasional strong storms may bring brief periods of high winds with gusts to more than 50 miles per hour.

Growth of cool season plants begins in early to mid March, slowing or ceasing in late June. Warm season plants begin growth about mid May and can continue to early or mid September. Green up of cool season plants may occur in September and October when adequate soil moisture is present.

Representative Soil Features

The soils in this site are somewhat poorly drained and formed in loamy or sandy alluvium. The surface layer is 1 to 12 inches thick. The texture of the subsurface ranges from very fine sandy loam to clay loam. Finer textured layers may occur in the lower parts of some profiles. This site should show no evidence of rills, wind scoured areas or pedestalled plants. Water flow paths are broken, irregular in appearance or discontinuous with numerous debris dams or vegetative barriers. The soil surface is stable and intact.

More information can be found in the various soil survey reports. Contact the local USDA Service Center for soil survey reports that include more detail specific to your location.

Parent Material Kind: alluvium
Parent Material Origin: mixed
Surface Texture: clay loam, loam, very fine sandy loam
Surface Texture Modifier: none
Subsurface Texture Group: loamy
Surface Fragments ≤ 3" (% Cover): 0
Surface Fragments > 3" (%Cover): 0
Subsurface Fragments ≤ 3" (% Volume): 0-10
Subsurface Fragments > 3" (% Volume): 0-5

	Minimum	Maximum
Drainage Class:	poorly	somewhat poorly
Permeability Class:	moderately slow	moderately rapid
Depth (inches):	80	80

Plant Communities

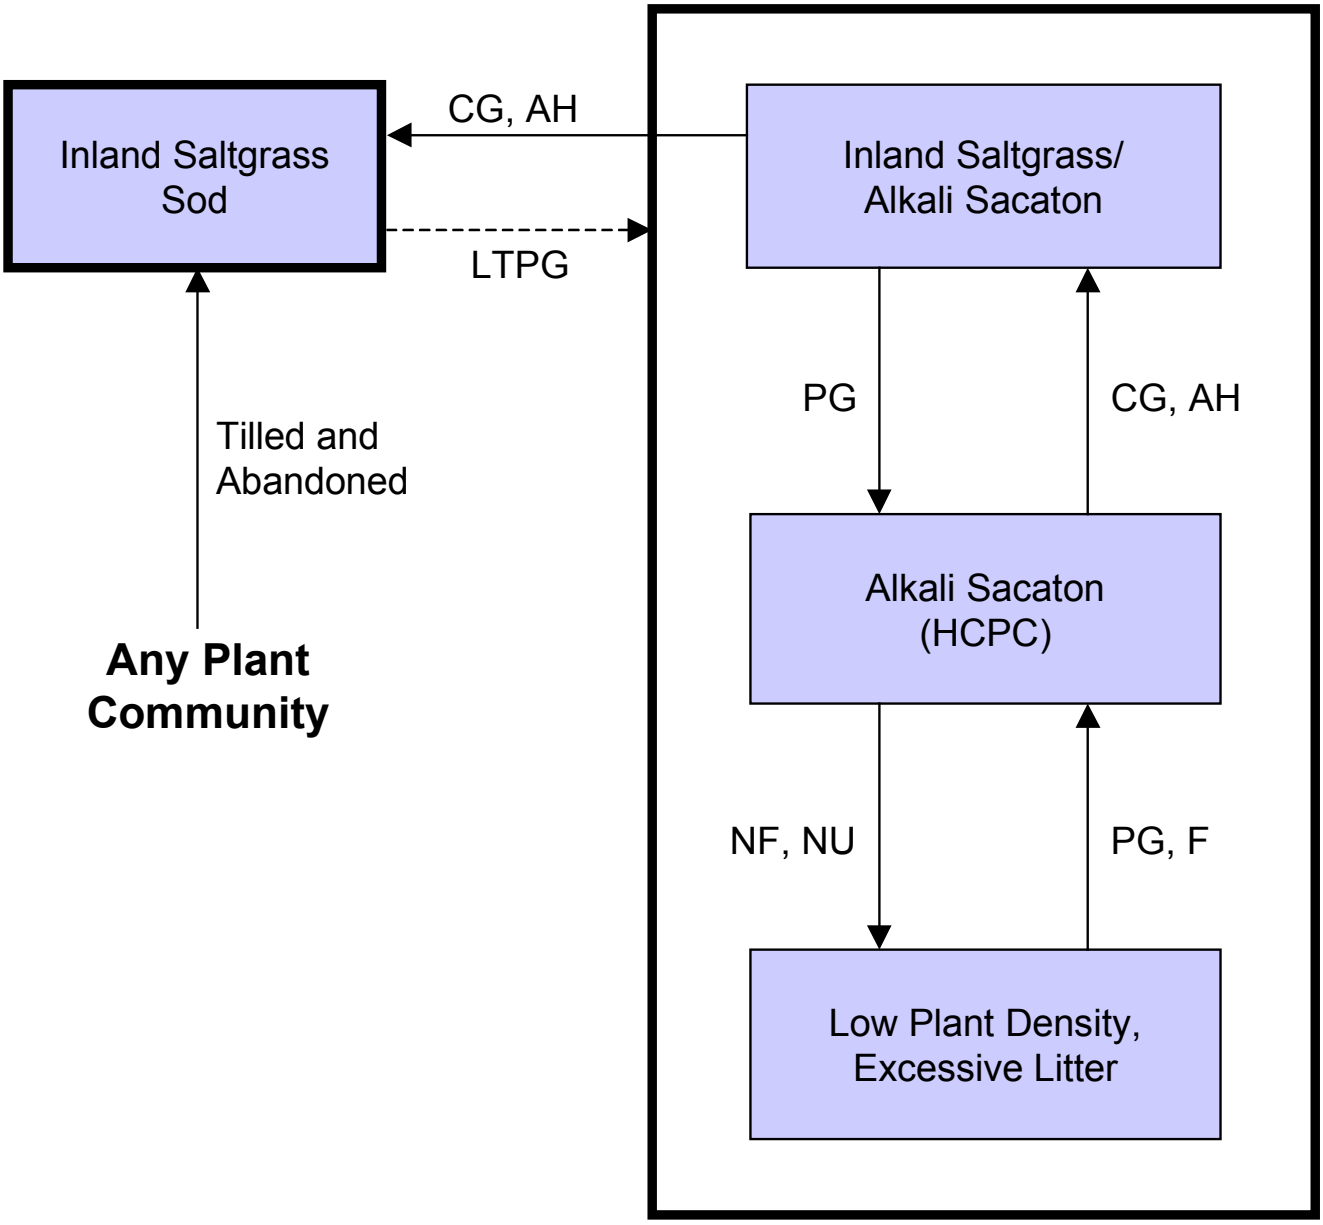
Ecological Dynamics of the Site:
This site developed under Northern Great Plains climatic conditions, natural influences of large herbivores, occasional fire, and other biotic and abiotic factors that typically influence soil/site development. Changes will occur in the plant communities due to short-term weather variations, impacts of native and/or exotic plant and animal species, and management actions. While the following plant community descriptions describe more typical transitions between communities that will occur, severe disturbances, such as periods of well-below average precipitation, can cause significant shifts in plant communities and/or species composition.

As this site deteriorates, species such as inland saltgrass and foxtail barley increase. Grasses such as alkali sacaton, alkali cordgrass, western wheatgrass and slender wheatgrass will decrease in frequency and production.

The plant community upon which interpretations are primarily based is the Historic Climax Plant Community (HCPC). The HCPC has been determined by studying rangeland relic areas, areas protected from excessive disturbance, and areas under long-term rotational grazing regimes. Trends in plant community dynamics ranging from heavily grazed to lightly grazed areas, seasonal use pastures, and historical accounts also have been used. Plant communities, states, transitional pathways, and thresholds have been determined through similar studies and experience.

The following is a diagram that illustrates the common plant communities that can occur on the site and the transition pathways between communities. The ecological processes are discussed in more detail in the plant community descriptions following the diagram.

Plant Communities and Transitional Pathways



AH - annual haying; **CG** - continuous grazing w/o adequate recovery periods; **F-** Fire; **HCPC** - Historic Climax Plant Community; **LTPG -** long term prescribed grazing (> 40 years); **NF-** no fire; **NU** - non-use; **PG** - prescribed grazing with adequate recovery periods.

Plant Community and Vegetation State Narratives

Following are the narratives for each of the described plant communities. These plant communities may not represent every possibility, but they are the most prevalent and repeatable plant communities. The plant composition tables shown above have been developed from the best available knowledge at the time of this revision. As more information is collected, some of these plant community descriptions may be revised or removed, and new ones added. None of these plant communities should necessarily be thought of as “Desired Plant Communities”. According to the USDA NRCS National Range and Pasture Handbook, Desired Plant Communities (DPC’s) will be determined by the decision makers and will meet minimum quality criteria established by the NRCS. The main purpose for including any description of a plant community here is to capture the current knowledge and experience at the time of this revision.

Alkali Sacaton Plant Community

Interpretations are based primarily on the Alkali Sacaton Plant Community. This is also considered the Historic Climax Plant Community (HCPC). This plant community can be found on areas that are properly managed with grazing and/or prescribed burning, and sometimes on areas receiving occasional short periods of deferment. This plant community consists mainly of mid warm and cool season grasses. The principle dominant plants are alkali sacaton, inland saltgrass and western wheatgrass. Grasses of secondary importance are alkali cordgrass, slender wheatgrass, little bluestem and foxtail barley. Blue grasses, sedges and spike rushes occur as an understory. Forbs such as heath aster, milkvetch and prairie gentian are significant. This plant community is about 80-95% grasses, 5-15% grass-likes and 0-5% forbs.

This plant community is adapted to high salt content inherent of the soils. White crusts can occupy many areas of the soil surface due to seasonal fluctuations in the water table. Plant litter is properly distributed with very little movement off-site and natural plant mortality is very low. Most plant species have a wide range of age classes represented and reproduction is not limited.

The following growth curve shows the estimated monthly percentages of total annual growth of the dominant species expected during an average year:
Growth curve number: SD6009
Growth curve name: Pierre Shale Plains, warm-season dominant, cool-season sub-dominant.
Growth curve description: Warm-season dominant, cool-season sub-dominant, lowland.

JAN	FEB	MAR	APR	MAY	JUN	JUL	AUG	SEP	OCT	NOV	DEC
0	0	3	10	16	22	23	14	7	5	0	0

Transitional pathways and/or community pathways leading to other plant communities are as follows:

- Continuous grazing without adequate recovery periods following grazing events or annual haying will convert this plant community to the *Inland Saltgrass/Alkali Sacaton Plant Community*.
- Non-use and no fire will convert this plant community to the *Low Plant Density, Excessive Litter Plant Community.*

Inland Saltgrass, Alkali Sacaton Plant Community

This plant community developed with relatively short term continuous grazing without periodic deferment, or with annual haying. Plants resistant to removal are maintaining vigor. The potential vegetation is about 80-95% grasses, 5-15% grass-like plants, and 1-5% forbs. Inland saltgrass and alkali sacaton have increased in abundance. Most of the palatable plants such as western wheatgrass, slender wheatgrass, and alkali cordgrass are present but occur in lesser amounts.

The soil is stable; however, plant diversity has been reduced. The water cycle, nutrient cycle and energy flow are slightly reduced but continue to adequately function. This community indicates key management concerns. Proper grazing management techniques at this point will stabilize the community at or near the Alkali Sacaton Plant Community. Increased disturbance can easily move the community to a more degraded scenario.

The following growth curve shows the estimated monthly percentages of total annual growth of the dominant species expected during an average year:
Growth curve number: SD6009
Growth curve name: Pierre Shale Plains, warm-season dominant, cool-season sub-dominant.
Growth curve description: Warm-season dominant, cool-season sub-dominant, lowland.

JAN	FEB	MAR	APR	MAY	JUN	JUL	AUG	SEP	OCT	NOV	DEC
0	0	3	10	16	22	23	14	7	5	0	0

Transitional pathways and/or community pathways leading to other plant communities are as follows:

- Continuous grazing or annual haying with no recovery opportunity shifts this plant community to the *Inland Saltgrass Sod Plant Community*.
- Prescribed grazing with adequate recovery opportunity will restore this community back to the *Alkali Sacaton Plant Community*.

Low Plant Density, Excessive Litter Plant Community

This plant community occurs after an extended period of non-use by domestic livestock. Fire is uncommon or absent. Litter has amounts increased causing plant density to decrease. Typically, bunchgrasses (alkali sacaton) have developed dead centers and rhizomatous grasses (inland saltgrass) form small colonies because of a lack of tiller stimulation. Salt crusts and/or annual plant species such as kochia and Russian thistle commonly fill bare ground areas. Plant frequency and production have decreased. The potential vegetation is about 75-90% grasses, 10-20% grass-like plants, and 1-5% forbs. Soil erosion is not a concern due to increased litter and landscape position.

The following growth curve shows the estimated monthly percentages of total annual growth of the dominant species expected during an average year:
Growth curve number: SD6008
Growth curve name: Pierre Shale Plains, lowland cool-season/warm-season co-dominant.
Growth curve description: Cool-season, warm-season co-dominant, lowland.

JAN	FEB	MAR	APR	MAY	JUN	JUL	AUG	SEP	OCT	NOV	DEC
0	0	4	11	19	23	20	12	6	5	0	0

Transitional pathways and/or community pathways leading to other plant communities are as follows:

- Prescribed grazing or fire with adequate recovery opportunity or prescribed burning will shift this plant community towards the *Alkali Sacaton Plant Community*.

Inland Saltgrass Sod Plant Community

This plant community developed with further continuous grazing or areas that have been tilled and abandoned. Inland saltgrass dominates this plant community and has developed into a sod bound condition. Alkali sacaton has been greatly reduced. Slender and western wheatgrass are gone and have been replaced by increased amounts of foxtail barley. Plains pricklypear has increased. Forbs such as kochia and Russian thistle have also increased. The potential vegetation is about 80-95% grasses, 5-15% grass-like plants, and 1-5% forbs. The plant community lacks diversity. Evaporation has increased resulting in a higher salt content on the soil surface. Organic matter/carbon reserves are severely diminished. It will take a long time to bring this plant community back to the Alkali Sacaton Plant Community with management alone. Renovation of this plant community would be very costly due to high salt content and water table.

The following growth curve shows the estimated monthly percentages of total annual growth of the dominant species expected during an average year:
Growth curve number: SD6010
Growth curve name: Pierre Shale Plains, lowland warm-season dominant.
Growth curve description: Warm-season dominant, lowland.

JAN	FEB	MAR	APR	MAY	JUN	JUL	AUG	SEP	OCT	NOV	DEC
0	0	2	8	15	21	26	15	8	5	0	0

Transitional pathways and/or community pathways leading to other plant communities are as follows:

- Long term prescribed grazing with adequate recovery periods between grazing events will move this plant community to the *Inland Saltgrass/Alkali Sacaton Plant Community* and eventually to the *Alkali Sacaton Plant Community*.

Animal Community – Grazing Interpretations

The following table lists annual, suggested initial stocking rates with average growing conditions. These are conservative estimates that should be used only as guidelines in the initial stages of conservation planning. Often, the current plant composition does not entirely match any particular plant community (as described in this ecological site description). Because of this a resource inventory is necessary to document plant composition and production. More accurate carrying capacity estimates should eventually be calculated using the following stocking rate information along with animal preference data and actual stocking records, particularly when grazers other than cattle are involved. With consultation of the land manager, more intensive grazing management may result in improved harvest efficiencies and increased carrying capacity.

Plant Community	Average Annual Production (lbs./acre, air-dry)	Stocking Rate* (AUM/acre)
Alkali Sacaton	2800	0.89
Inland Saltgrass/Alkali Sacaton	1700	0.54
Inland Saltgrass Sod	1000	0.32
Low Plant Density, Excessive Litter	1900	0.60

* Based on 790 lbs./acre (air-dry weight) per Animal Unit Month (AUM), and on 25% harvest efficiency (refer to USDA NRCS, National Range and Pasture Handbook).

Grazing by domestic livestock is one of the major income-producing industries in the area. Rangeland in this area may provide yearlong forage. During the dormant period, the forage for livestock will likely be lacking protein to meet livestock requirements, and added protein will allow ruminants to better utilize the energy stored in grazed plant materials. A forage quality test (either directly or through fecal sampling) should be used to determine the level of supplementation needed.

Hydrology Functions

Water is the principal factor limiting herbage production on this site. The site is dominated by soils in hydrologic groups C and D. High water tables provide subirrigation of salt tolerant vegetation. Surrounding upland areas tend to have permeable soils and surface inflow peaks on these sites are often muted. These sites do not flood or are flooded only occasionally for brief periods. In many cases, areas with greater than 75% ground cover have the greatest potential for high infiltration and lower runoff. An exception would be where shortgrasses form a dense sod and dominate the site. Normally areas where ground cover is less than 50% have the greatest potential to have reduced infiltration and higher runoff (refer to Section 4, NRCS National Engineering Handbook for runoff quantities and hydrologic curves).

Recreational Uses

This site provides hunting opportunities for upland game species. The wide variety of plants which bloom from spring until fall have an esthetic value that appeals to visitors.

Wood Products

Other Products

Seed harvest of native plant species can provide additional income on this site.
