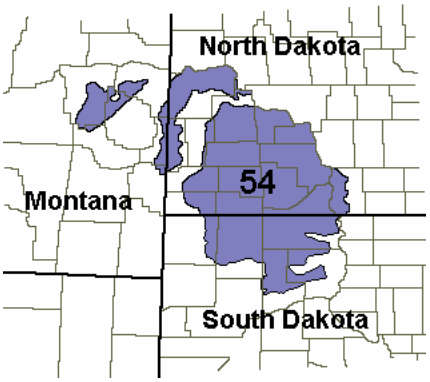
FORAGE SUITABILITY GROUP (FSG)

Very Droughty Loam

FSG No.: G054XY130ND

Major Land Resource Area (MLRA): 54 - Rolling Soft Shale Plain



Physiographic Features

The soils in this group are found mostly on uplands, pediments, terraces, and flood plains.

	Minimum	Maximum
Elevation (feet):	1600	3600
Slope (percent):	0	9
Flooding:		
Frequency:	None	Occasional
Duration:	None	Brief
Ponding:		
Depth (inches):		
Frequency:	None	None
Duration:	None	None
Runoff Class:	Very low	Medium

Climatic Features

This group occurs in a mid-continental climate characterized by wide seasonal temperature and precipitation fluctuations and extremes.

Annual precipitation varies widely from year to year in MLRA 54. Average annual precipitation for all climate stations listed below is about 17 inches. About 78 percent of that occurs during the months of April through September. On average, there are about 25 days with greater than .1 inches of precipitation during the same time period.

Average annual snowfall ranges from 23 inches at McLaughlin, South Dakota (SD),. to 48 inches at Glad Valley, SD. Snow cover at depths greater than 1 inch range from 20 days at Bison, SD, to 92 days at Hebron, North Dakota (ND).

Average July temperatures are about 71°F and average January temperatures are about 13°F. Recorded temperature extremes in the MLRA during the years 1961 to 1990 are a low of -49°F at Breien, ND, and a high of 111 recorded at Hettinger, ND. The MLRA lies in USDA Plant Hardiness Zones 3b, 4a, and 4B.

At Bismarck, the closest station with such records, the average morning relative humidity in June is about 84 percent and average afternoon humidity is 55 percent. It is cloudy an average of 165 days a year.

The climate data listed in the tables below represent high and low ranges and averages for the climate stations and dates listed. For additional climate data access the National Water and Climate Center at http://www.wcc.nrcs.usda.gov.

	From	To
Freeze-free period (28 deg)(days): (9 years in 10 at least)	108	140
Last Killing Freeze in Spring (28 deg): (1 year in 10 later than)	May 31	May 12
Last Frost in Spring (32 deg): (1 year in 10 later than)	Jun 07	May 23

	From	To
First Frost in Fall (32 deg): (1 year in 10 earlier than)	Aug 29	Sep 11

Soil Interpretations

This group consists of moderately deep to very deep, well to excessively drained, moderately coarse to medium textured soils formed in loamy and sandy materials. Some are moderately deep over sand and gravel or bedrock. Available water capacity is low due to moderate depths to sand and gravel or bedrock.

Drainage Class:	Well drained	To	Excessively drained
Permeability Class: (0 - 40 inches)	Moderately slow	To	Moderately rapid
Frost Action Class:	Low	To	Moderate

	Minimum	Maximum
Depth:	20	
Surface Fragments >3" (% Cover):	0	3
Organic Matter (percent): (surface layer)	1.0	5.0
Electrical Conductivity (mmhos/cm): (0 - 24 inches)	0	4
Sodium Absorption Ratio: (0 - 12 inches)	0	1
Soil Reaction (1:1) Water (pH): (0 - 12 inches)	6.1	7.8
Available Water Capacity (inches): (0 - 60 inches)	3	8
Calcium Carbonate Equivalent (percent): (0 - 12 inches)	0	10

Adapted Species List

The following forage species are considered adapted to grow on the soils in this group. Additional information concerning plant characteristics of a number of the listed species as well as individual cultivars of many of those species can be accessed at http://plants.usda.gov/

Cool Season Grasses	Symbol	Adapted	Warm Season Grasses	Symbol	Adapted
Canada wildrye	ELCA	F	Blue grama	BOGR2	G
Crested wheatgrass	AGCR	G	Little bluestem	SCSC	F
Dahurian wildrye	ELDA3	F	Prairie sandreed	CALO	F
Intermediate wheatgrass	THIN6	F	Sand bluestem	ANHA	F
Newhy hybrid wheatgrass		F	Sideoats grama	BOCU	F
Pubescent wheatgrass	THIN6	F	**Legumes**		
Russian wildrye	PSJU3	F	Alfalfa	MESA	F
Siberian wheatgrass	AGFR	G	American vetch	VIAM	F
Slender wheatgrass	ELTR7	F	Purple prairieclover	DAPUP	G
Smooth bromegrass	BRINI2	F	Sainfoin	ONVI	F
Western wheatgrass	PASM	F	Sweetclover	MELIL	F
			White prairieclover	DACAC	G

G - Good adaptation for forage production on this group of soils in this MLRA
F - Fair adaptation but will not produce at its highest potential

Production Estimates

Production estimates listed here should only be used for making general management recommendations. Onsite production information should always be used for making detailed planning and management recommendations.

The high forage production estimates listed below are based on dense, vigorous stands of climatically adapted, superior performing cultivars. They are properly fertilized for high yields and pest infestations are kept below economic thresholds. Mechanical harvests are managed to maintain stand life by cutting at appropriate stages of maturity and harvest intervals. If grazed, optimum beginning and ending grazing heights are adhered to. Adequate time is allowed for plant recovery before entering winter dormancy under both uses.

The production estimates listed below represent total annual above ground plant production on an air-dry-matter basis. Estimates of hay and grazing yields can be calculated from these numbers by multiplying them by a harvest efficiency. A 70 percent harvest efficiency is commonly used when converting to hay yields. Pasture harvest efficiency is highly dependent on the grazing management system applied, ranging from 25 to 50 percent.

Forage Crop	Management Intensity	
	High (lbs/ac)	Low (lbs/ac)
Crested wheatgrass	2500	1100
Pubescent wheatgrass	2500	1100
Western wheatgrass	1700	1000

Forage Growth Curves

Growth curves estimate the seasonal distribution of growth of the various forage crops. They indicate when the forages may be available for grazing or mechanical harvest.

Growth Curve Number: ND0001

Soil Limitations

The primary limitation for these soils is their moderate depth to sand and gravel and resulting low available water capacity which limits species selection and production potential. On steeper slopes water erosion is a potential problem during establishment, when renovating stands, and in thin established stands. Livestock trail erosion is a potential problem on established stands. Also, wind erosion is a potential problem during stand establishment on moderately coarse textured soils.

Management Interpretations

The impact on yields of the low available water capacity of these soils can be reduced by selecting forage species that are highly tolerant to periods of drought and inadequate soil moisture. Including sod forming grass species in stands, especially on steeper slopes, will reduce the potential for sheet and rill erosion. Incorporate both wind and water erosion control practices during the establishment period. Properly locating facilitating practices such as fences, lanes, and water developments can help control livestock movement, reduce trailing perpendicular to steeper slopes, and evenly distribute grazing pressure.

Pasture and hayland can include considerations for wildlife. Delaying grazing on portions of the pasture or rotating pastures will allow nest initiation of grassland nesting birds or species of concern. Nest initiation of most grassland nesting birds occurs from April 15 to June 1. Delaying haying until after July 15 allows for most species to fledge their young. Consider planting species with later maturity to allow for harvesting after nests have fledged. Avoid mowing around the field. Mow back and forth or from the inside to the outside of the field. Consider using flushing bars on swathers and mowers.
