

## FORAGE SUITABILITY GROUP (FSG)

### Sand

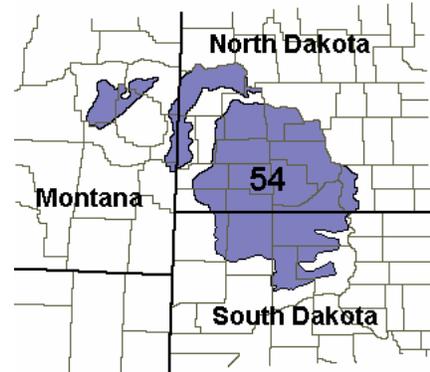

FSG No.: G054XY300ND

Major Land Resource Area (MLRA): 54 - Rolling Soft Shale Plain

#### Physiographic Features

The soils in this group are found on upland slopes, stream terraces, levees, and flood plains.

	<u>Minimum</u>	<u>Maximum</u>
<b>Elevation (feet):</b>	1600	3600
<b>Slope (percent):</b>	0	15
<b>Flooding:</b>		
<b>Frequency:</b>	None	Occasional
<b>Duration:</b>	None	Brief
<b>Ponding:</b>		
<b>Depth (inches):</b>		
<b>Frequency:</b>	None	None
<b>Duration:</b>	None	None
<b>Runoff Class:</b>	Negligible	Medium

#### Climatic Features

This group occurs in a mid-continental climate characterized by wide seasonal temperature and precipitation fluctuations and extremes.

Annual precipitation varies widely from year to year in MLRA 54. Average annual precipitation for all climate stations listed below is about 17 inches. About 78 percent of that occurs during the months of April through September. On average there are about 25 days with greater than .1 inches of precipitation during the same time period.

Average annual snowfall ranges from 23 inches at McLaughlin, South Dakota (SD), to 48 inches at Glad Valley, SD. Snow cover at depths greater than 1 inch range from 20 days at Bison, SD, to 92 days at Hebron, North Dakota (ND).

Average July temperatures are about 71°F and average January temperatures are about 13°F. Recorded temperature extremes in the MLRA during the years 1961 to 1990 are a low of -49°F at Breien, ND, and a high of 111 recorded at Hettinger, ND. The MLRA lies in USDA Plant Hardiness Zones 3b, 4a, and 4B.

At Bismarck, the closest station with such records, the average morning relative humidity in June is about 84 percent and average afternoon humidity is 55 percent. It is cloudy an average of 165 days a year.

The climate data listed in the tables below represent high and low ranges and averages for the climate stations and dates listed. For additional climate data access the National Water and Climate Center at <http://www.wcc.nrcs.usda.gov>.

**Soil Interpretations**

This group consists of moderately deep to very deep, well to excessively drained, moderately coarse, and coarse textured soils formed in sandy eolian and alluvial materials or materials weathered from sandstone. Permeability is rapid.

<b>Drainage Class:</b>	Moderately well drained	To	Excessively drained
<b>Permeability Class:</b> (0 - 40 inches)	Rapid	To	Rapid
<b>Frost Action Class:</b>	Low	To	Moderate

	<u>Minimum</u>	<u>Maximum</u>
<b>Depth:</b>	20	
<b>Surface Fragments &gt;3" (% Cover):</b>	0	0
<b>Organic Matter (percent):</b>	0.5	3.0
<b>Electrical Conductivity (mmhos/cm):</b> (0 - 24 inches)	0	4
<b>Sodium Absorption Ratio:</b> (0 - 12 inches)	0	1
<b>Soil Reaction (1:1) Water (pH):</b> (0 - 12 inches)	6.1	8.4
<b>Available Water Capacity (inches):</b> (0 - 60 inches)	2	7
<b>Calcium Carbonate Equivalent (percent):</b> (0 - 12 inches)	0	15

### Adapted Species List

The following forage species are considered adapted to grow on the soils in this group. Additional information concerning plant characteristics of a number of the listed species as well as individual cultivars of many of those species can be accessed at <http://plants.usda.gov/>

<u>Cool Season Grasses</u>	<u>Symbol</u>	<u>Adapted</u>	<u>Warm Season Grasses</u>	<u>Symbol</u>	<u>Adapted</u>
Canada wildrye	ELCA4	G	Blue grama	BOGR2	F
Crested wheatgrass	AGCR	F	Little bluestem	SCSC	G
Dahurian wildrye	ELDA3	F	Prairie sandreed	CALO	G
Intermediate wheatgrass	THIN6	F	Sand bluestem	ANHA	G
Newhy hybrid wheatgrass		F	Sideoats grama	BOCU	F
Pubescent wheatgrass	THIN6	F	<u>Legumes</u>	<u>Symbol</u>	<u>Adapted</u>
Russian wildrye	PSJU3	F	Alfalfa	MESA	F
Russian wildrye	PSJU3	F	American vetch	VIAM	F
Siberian wheatgrass	AGFR	G	Canada milkvetch	ASCAC6	F
Slender wheatgrass	ELTR7	F	Cicer milkvetch	ASCI4	F
Western wheatgrass	PASM	F	Purple prairieclover	DAPUP	F
			Sainfoin	ONVI	F
			Sweetclover	MELIL	F
			White prairieclover	DACAC	F

G - Good adaptation for forage production on this group of soils in this MLRA

F - Fair adaptation but will not produce at its highest potential

### Production Estimates

Production estimates listed here should only be used for making general management recommendations. Onsite production information should always be used for making detailed planning and management recommendations.

The high forage production estimates listed below are based on dense, vigorous stands of climatically adapted, superior performing cultivars. They are properly fertilized for high yields, and pest infestations are kept below economic thresholds. Mechanical harvests are managed to maintain stand life by cutting at appropriate stages of maturity and harvest intervals. If grazed, optimum beginning and ending grazing heights are adhered to. Adequate time is allowed for plant recovery before entering winter dormancy under both uses.

The production estimates listed below represent total annual above ground plant production on an air-dry-matter basis. Estimates of hay and grazing yields can be calculated from these numbers by multiplying them by a harvest efficiency. A 70 percent harvest efficiency is commonly used when converting to hay yields. Pasture harvest efficiency is highly dependent on the grazing management system applied, ranging from 25 to 50 percent.

**Forage Crop****Management Intensity**

	<b><u>High</u></b> <b>(lbs/ac)</b>	<b><u>Low</u></b> <b>(lbs/ac)</b>
Alfalfa	4000	2000
Alfalfa/Intermediate wheatgrass	3200	1600
Crested wheatgrass	2800	1400
Intermediate wheatgrass	2800	1600
Sand bluestem	3800	2000

**Forage Growth Curves**

Growth curves estimate the seasonal distribution of growth of the various forage crops. They indicate when the forages may be available for grazing or mechanical harvest.

**Soil Limitations**

Soil blowing is a severe hazard during stand establishment or renovation of forage stands on the soils of this group. Bare areas where livestock concentrate are also susceptible. Production potential is low to moderate due to the low available water capacity and droughtiness of these soils. Also, these soils are typically low in native fertility and have reduced capacity to supply plant nutrients. Species choices are somewhat limited for pasture and hayland for these same reasons.

**Management Interpretations**

The impact on yields of the low available water capacity of these soils can be reduced by selecting forage species that are highly tolerant to periods of drought and inadequate soil moisture and can grow on coarse soils.

Incorporate wind erosion control practices during stand establishment. Properly locating facilitating practices such as fences, lanes, and water developments can help control livestock movement, reduce trailing perpendicular to steeper slopes, evenly distribute grazing pressure, and reduce bare areas.

Pasture and hayland can include considerations for wildlife. Delaying grazing on portions of the pasture or rotating pastures will allow nest initiation of grassland nesting birds or species of concern. Nest initiation of most grassland nesting birds occurs from April 15 to June 1. Delaying haying until after July 15 allows for most species to fledge their young. Consider planting species with later maturity to allow for harvesting after nests have fledged. Avoid mowing around the field. Mow back and forth or from the inside to the outside of the field. Consider using flushing bars on swathers and mowers.
