

FORAGE SUITABILITY GROUP (FSG)

Limy Upland

FSG No.: G062XY400SD

Major Land Resource Area (MLRA): 062X - Black Hills

Physiographic Features

These soils are on long, narrow, gently sloping bottoms or valleys and strongly sloping toeslopes.

	<u>Minimum</u>	<u>Maximum</u>
Elevation (feet):	3600	6600
Slope (percent):	2	9
Flooding:		
Frequency:	Rare	Rare
Duration:	Very Brief	Very Brief
Ponding:		
Depth (inches):		
Frequency:	None	None
Duration:	None	None
Runoff Class:	Low	Low

Climatic Features

The climate of MLRA 62 is influenced by the mountainous Black Hills. Annual precipitation is generally higher and temperature is lower than the plains and foothills which surround it. Growing season length is considerably reduced with the potential for frost at the higher elevations occurring virtually every month of the year.

Annual precipitation varies widely from year to year in MLRA 62. Average annual precipitation for all climate stations listed below is about 24 inches, with about 73 percent of that occurring during the months of April through September. On average, there are about 34 days with greater than .1 inches of precipitation during the same time period. Precipitation is less than needed for optimum forage production and is the single largest factor limiting production from this group on non-irrigated lands.

Average annual snowfall ranges from 42 inches at Custer, South Dakota (SD), to 164 inches at Lead, SD. Days with snow cover at depths greater than 1 inch range from 18 days at Deadwood, SD, to 120 days at Alva, Wyoming (WY).

Average July temperatures across the MLRA are about 67°F and average January temperatures are about 22°F. Recorded temperature extremes in the MLRA during the years 1961 to 1990 are a low of -43°F at Custer, and a high of 102 at both Alva and Deadwood. The MLRA lies in USDA Plant Hardiness Zones 4b and 5a.

The climate data listed in the tables below represent high and low ranges and averages for the climate stations and dates listed. For additional climate data access the National Water and Climate Center at <http://www.wcc.nrcs.usda.gov>.

	From	To
Freeze-free period (28 deg)(days): (9 years in 10 at least)	89	127
Last Killing Freeze in Spring (28 deg): (1 year in 10 later than)	Jun 08	May 23
Last Frost in Spring (32 deg): (1 year in 10 later than)	Jul 03	Jun 03

	From	To
First Frost in Fall (32 deg): (1 year in 10 earlier than)	Aug 20	Sep 10
First Killing Freeze in Fall (28 deg): (1 year in 10 earlier than)	Aug 30	Sep 20

Soil Interpretations

This group consists of very deep, somewhat excessively drained, moderately rapidly permeable soils that formed in mixed alluvium from sedimentary rocks.

Drainage Class:	Excessively drained	To	Somewhat excessively drained
Permeability Class: (0 - 40 inches)	Moderately rapid	To	Moderately rapid
Frost Action Class:	Moderate	To	Moderate

	<u>Minimum</u>	<u>Maximum</u>
Depth:	72	
Surface Fragments >3" (% Cover):		
Organic Matter (percent): (surface layer)	1.0	3.0
Electrical Conductivity (mmhos/cm): (0 - 24 inches)	0	2
Sodium Absorption Ratio: (0 - 12 inches)	0	0
Soil Reaction (1:1) Water (pH): (0 - 12 inches)	7.4	8.4
Available Water Capacity (inches): (0 - 60 inches)	4	5
Calcium Carbonate Equivalent (0 - 12 inches)	0	15

Soil Map Unit Component List (Some phases of these soils may also occur in other FSG's.)

Winetti

Adapted Species List

The following forage species are considered adapted to grow on the soils in this group. Additional information concerning plant characteristics of a number of the listed species as well as individual cultivars of many of those species can be accessed on the web at <http://plants.usda.gov>.

<u>Cool Season Grasses</u>	<u>Symbol</u>	
Crested wheatgrass	AGCR	G
Green needlegrass	NAVI4	F
Intermediate wheatgrass	THIN6	F
Newhy hybrid wheatgrass	F	
Pubescent wheatgrass	THIN6	F
Western wheatgrass	PASM	G
<u>Warm Season Grasses</u>	<u>Symbol</u>	
Big bluestem	ANGE	F
Little bluestem	SCSC	G
Sideoats grama	BOCU	G
<u>Legumes</u>	<u>Symbol</u>	
Cicer milkvetch	ASCI4	G
Purple prairieclover	DAPUP	F
Sainfoin	ONVI	F
White prairieclover	DACAC	F

G - Good adaptation for forage production on this group of soils in this MLRA

F - Fair adaptation but will not produce at its highest potential

Production Estimates

Production estimates listed here should only be used for making general management recommendations. Onsite production information should always be used for making detailed planning and management recommendations.

The high forage production estimates listed below are based on dense, vigorous stands of climatically adapted, superior performing cultivars. They are properly fertilized for high yields, and pest infestations are kept below economic thresholds. Mechanical harvests are managed to maintain stand life by cutting at appropriate stages of maturity and harvest intervals. If grazed, optimum beginning and ending grazing heights are adhered to. Adequate time is allowed for plant recovery before entering winter dormancy under both uses.

The production estimates listed below represent total annual above ground plant production on an air-dry-matter basis. Estimates of hay and grazing yields can be calculated from these numbers by multiplying them by the expected harvest efficiency. A 70 percent harvest efficiency is commonly used when converting to hay yields. Pasture harvest efficiency is highly dependent on the grazing management system applied, ranging from 25 to 50 percent.

Forage Crop	<u>Dryland</u>	
	Management Intensity	
	<u>Low</u> (lbs/ac)	<u>High</u> (lbs/ac)
Crested wheatgrass	2200	4500
Intermediate wheatgrass	2300	4700
Western wheatgrass	1900	4200

Forage Growth Curves

Growth curves estimate the seasonal distribution of growth of the various forage crops. They indicate when the forages may be available for grazing or mechanical harvest.

Growth Curve Number: SD0006

Soil Limitations

The primary limitation to the soils in this group is the high lime content close to the soil surface. The lime reduces the availability of some plant nutrients. This reduces species choices and yield potential.

Management Interpretations

The impact on yields can be reduced by selecting forage species that are tolerant of the high lime levels inherent to these soils. Including sod forming grass species in stands, especially on steeper slopes, will reduce the potential for sheet and rill erosion. Incorporate both wind and water erosion control practices during the establishment period. Properly locating facilitating practices such as fences, lanes, and water developments can help control livestock movement, reduce trailing perpendicular to steeper slopes, and evenly distribute grazing pressure.
