

FORAGE SUITABILITY GROUP Very Droughty Loam

FSG No.: G102BY130SD

Major Land Resource Area: 102B - Till Plains

Physiographic Features

The soils in this group are found on uplands and on outwash plains and terraces.

	<u>Minimum</u>	<u>Maximum</u>
Elevation (feet):	980	1640
Slope (percent):	0	9

Runoff Class:	Negligible	Medium

Climatic Features

Annual precipitation varies widely from year to year in MLRA 102B. Average annual precipitation for all climate stations listed below is about 24 inches. Over 75 percent of that occurs during the months of April through September. On average, there are about 30 days with greater than .1 inches of precipitation during the same timeframe.

Average annual snowfall ranges from 25 to 39 inches across the MLRA. Snow cover at depths greater than 1 inch range from 15 days at Bridgewater to 79 days at Madison.

Average July temperatures are about 75⁰F and average January temperatures are about 15⁰F. Recorded temperature extremes in the MLRA are a low of -36 degrees and a high of 110 degrees both recorded at Sioux Falls.

Average annual wind speeds at Sioux Falls are 11 mph with the highest wind speeds occurring during March and April. It is cloudy an average of 157 days a year at Sioux Falls, with the greatest incidence of cloudy weather occurring in November and December. Average morning relative humidity in June is 82 percent and average afternoon humidity is 59 percent.

The climate data listed in the tables below represent high and low ranges and averages for the climate stations and dates listed. For additional climate data, access the National Water and Climate Center at <http://www.wcc.nrcs.usda.gov>.

	From	To
Freeze-free period (28 deg)(days): (9 years in 10 at least)	139	154
Last Killing Freeze in Spring (28 deg): (1 year in 10 later than)	May 13	May 03

Soil Interpretations

This group consists mostly of very deep, somewhat excessively drained, medium to moderately coarse textured soils. Available water capacity is low due to the moderately coarse soil texture or moderate depths to sand and gravel.

Drainage Class:	Somewhat excessively drained	To	Somewhat excessively drained
Permeability Class: (0 - 40 inches)	Moderate	To	Moderately rapid
Frost Action Class:	Low	To	Low

	<u>Minimum</u>	<u>Maximum</u>
Depth:	20	
Surface Fragments >3" (% Cover):	0	3
Organic Matter (percent): (surface layer)	1.0	4.0
Electrical Conductivity (mmhos/cm): (0 - 24 inches)	0	2
Sodium Absorption Ratio: (0 - 12 inches)	0	0
Soil Reaction (1:1) Water (pH): (0 - 12 inches)	5.6	7.8
Available Water Capacity (inches): (0 - 60 inches)	4	6
Calcium Carbonate Equivalent (percent): (0 - 12 inches)	0	2

Adapted Species List

The following forage species are considered adapted to grow on the soils in this group. Additional information concerning plant characteristics of a number of the listed species as well as individual cultivars of many of those species can be accessed at <http://plants.usda.gov/>

<u>Cool Season Grasses</u>	<u>Dryland</u>	<u>Irrigated</u>
Green needlegrass	G	NS
Intermediate wheatgrass	F	G
Meadow brome	F	G
Orchardgrass	F	G
Pubescent wheatgrass	G	G
Smooth brome	F	G
Tall fescue	NS	F
Timothy	NS	F
Western wheatgrass	G	NS

<u>Warm Season Grasses</u>	<u>Dryland</u>	<u>Irrigated</u>
Big bluestem	F	G
Indiangrass	NS	G
Little bluestem	G	NS
Sideoats grama	G	NS
Switchgrass	NS	G

<u>Legumes</u>	<u>Dryland</u>	<u>Irrigated</u>
Alfalfa	G	G
Birdsfoot trefoil	NS	G
Cicer milkvetch	G	F
Purple prairieclover	G	NS
Red clover	NS	G
White prairieclover	F	NS

G - Good adaptation for forage production on this group of soils in this MLRA

F - Fair adaptation but will not produce at its highest potential

NS - Not suited

Production Estimates

Production estimates listed here should only be used for making general management recommendations. Onsite production information should always be used for making detailed planning and management recommendations.

The high forage production estimates listed below are based on dense, vigorous stands of climatically adapted, superior performing cultivars. They are properly fertilized for high yields and pest infestations are kept below economic thresholds. Mechanical harvests are managed to maintain stand life by cutting at appropriate stages of maturity and harvest intervals. If grazed, optimum beginning and ending grazing heights are adhered to. Adequate time is allowed for plant recovery before entering winter dormancy under both uses.

The production estimates listed below represent total annual above ground plant production on an air-dry-matter basis. Estimates of hay and grazing yields can be calculated from these numbers by multiplying them by a harvest efficiency. A 70 percent harvest efficiency is commonly used when converting to hay yields. Pasture harvest efficiency is highly dependent on the grazing management system applied, ranging from 25 to 50 percent.

Forage Crop	Dryland		Irrigated	
	Management Intensity		Management Intensity	
	<u>High</u> (lbs/ac)	<u>Low</u> (lbs/ac)	<u>High</u> (lbs/ac)	<u>Low</u> (lbs/ac)
Alfalfa	5100	2900		
Alfalfa/Intermediate wheatgrass	4300	2600	14300	8600
Alfalfa/Smooth brome	4300	2600	14300	8600
Intermediate wheatgrass	3700	2000	11400	6900
Smooth brome	3700	2000	11400	6900

Forage Growth Curves

Growth curves estimate the seasonal distribution of growth of the various forage crops. They indicate when the forages may be available for grazing or mechanical harvest.

Soil Limitations

The primary limitation for these soils is their low available water capacity due to moderate depth to bedrock or sand and gravel. This results in limited species selection and production potential. On steeper slopes, water erosion is a potential problem during establishment, when renovating stands, and in thin established stands. Livestock trail erosion is a potential problem on established stands. Also, wind erosion is a potential problem during stand establishment on moderately coarse textured soils.

Management Interpretations

The impact to yields of the low available water capacity of these soils can be reduced by selecting forage species that are highly tolerant of periods of drought and inadequate soil moisture. Including sod forming grass species in stands, especially on steeper slopes, will reduce the potential for sheet and rill erosion. Incorporate both wind and water erosion control practices during the establishment period. Properly locating facilitating practices such as fences, lanes, and water developments can help control livestock movement, reduce trailing perpendicular to steeper slopes, and evenly distribute grazing pressure.
